A Study In Contrasts

THE FIRST public railway for steam locomotives was opened between Stockton and Darlington, England, by Edward Peese and George Stephenson on September 27th, 1825. This event caused great excitement, and nearly everyone prophesied that the "iron horse," as the engine was called, would be a failure. The train weighed about 90 tons, and consisted of six waggons loaded with coal and flour. Then came a covered coach which held the directors and proprietors, with twenty-one coal waggons fitted up for invited passengers, these numbering nearly 600. Stephenson's engine, which was named the "Locomotion," had a ten foot boiler and weighed not quite 1,500 pounds. As six miles an hour was supposed to be the limit of speed, it was arranged that a man on horseback should ride on the track ahead of the engine, carrying a flag.

The train was started without mishap and many of the spectators attempted to keep up with it on foot, some on horseback galloping across the fields to accompany this new means of transportation. After a few minutes Stephenson got impatient and shouted to the horseman with the flag to get off the track, for, to use his own words, "I am going to let her go." Spectators and passengers were alike afraid, but hung on tight while Stephenson opened up the throttle. Soon he was going at 12 miles an hour, later finishing with a glorious spurt at the rate of 15 miles. Spectators were left far behind, and one newspaper reporting the incident said that the performance had exceeded even the most sanguine expectations.

Compare this first locomotive with the modern type which is capable of eating up distance at the rate of 82 miles per hour. Hundreds of improvements have been made in addition to that in speed until at present we have a carefully prepared and massive piece of mechanism which excites wonder even in the heart of locomotive men themselves. The latest achievement in locomotive history is the "Thinking Engine."

The danger of collision has been ever existent, and unfortunately has been the means of a heavy loss of life. Some weeks ago. A. R. Angus, an Australian, demonstrated in London, England, a new device which he has invented, and which makes the locomotive so safe from collisions that he named the engine the "thinking locomotive." Three tests were made. In the first, two locomotives going head on towards each other at great speed on a single track were automatically stopped on approaching the danger distance without the intervention of the engineer. In the second test a locomotive heading towards another standing still on the same track was similarly stopped, and in the third test a rapidly moving locomotive overtaking one moving slowly was stopped.

On another page we give a brief description of the device. The thought, however, which remains uppermost in our minds is that marvellous inventions are continually being perfected and yet attract practically no attention. Here we have a life saving device which practically eliminates the human element, yet we sit back and take it all for granted. It is to be hoped the invention proves a success and a commercial possibility, so that all engines may be equipped with this added safety measure. The present safety condition of our railroads is excellent, but anything we can do to make them fool-proof, so far as switch operators are concerned, would be well worth while.

IT IS REPORTED by a British investigator, Mr. F. G. Cawston, who has been studying leprosy at Durban, that the administration of colloidal antimony appears to produce good effects. According to the British Medical Journal, he found that lepers in an advanced state of the disease, with all of their fingers and toes suppurating, were helped to such an extent by this treatment that the suppuration entirely ceased.

It's not the public that has stopped buying—It's certain people that have stopped selling.

MARKET DEVELOPMENTS

A Lighter Demand Exists on Market This Week

Demand On Steel Mills Has Tapered Off—Pipe Mills Show Increase—Other Finished Steel Products Light in Demand—Machine Tool Market Not Very Brisk—Small Tool Market Steady

ALL MARKETS report a slight tapering off in business this week. From Pittsburg we hear that the steel mills are not so busy, although existing conditions are still much better than they were in July. Production of steel ingots is around the 40 per cent. mark, against a 20 per cent. rate in July.

The demand upon the pipe mills continues to increase, this being very evident in standard pipe and oil country goods. The latter will hardly hold up, as winter will naturally bring lighter demand. Bars are practically stationary; plates show a very light demand, and sheets are the only finished steel product with any strength. Wire products are rather quiet, but of course this condition is in keeping with the season of the year. Sheet, wire, pipe and tin plate mills are all operating at 50 per cent or better, this being well above the rate of steel production.

It is an open question as to whether finished steel prices are going up or down. Several increases have been made, also a few reductions. Considering the matter from all angles it would look as if there is a trend to go downward rather than upward, as a recent bullish effort was not successful in strengthening the prices of certain products.

The Steel Corporations latest report shows that it is possible to make money in steel production, even with a very light operation and existing high freight charges. This clears up an important point, for it was claimed that such a condition was out of the question.

The machine tool market is not very active. Competition is keen, and prices are being shaded in many cases in order to make sales. The small tool business is steady, and dealers in this line are quite content to wait, for they feel that things are bound to improve in the near future.

The scrap market refuses to come to life. The same inactivity continues, and it is likely to do so for some time. Although all lines show a lull in the number of orders, the dealers in these various markets are by no means downhearted. Many feel that business is simply marking time until after the election on December 6.

PIPE MILLS SHOW INCREASE IN DEMAND—BUT STEEL MILLS EASE UP

PITTSBURGH, November 3rd.—On the whole, demand upon the steel mills has tapered off a trifle in the past week. There is no important decrease in buying but the change is noteworthy in that the continued improvement for three months has ended, though perhaps only for a very short time. The change does not necessitate a decrease in steel production, for while the appearance has been for months past that all the buying was for prompt shipment, the fact is that some of the mills have accumulated a little volume of business for the remainder of the year.

Indeed, the mills as a whole appear to be operating at a slightly better average rate than two or three weeks ago, despite the fact of the market being a trifle less active. The rate of steel ingot production seems to be close to 40 per cent., with the Steel Corporation operating at that rate or a trifle more, and the independents at somewhat below 40 per cent. Production of steel ingots in October was probably at about 35 per cent., against about 32 per cent for September, while at the low point last July production dipped just below a 20 per cent. rate.

Demand by Products

While the steel markets as a whole show slightly lessened activity, demand upon the pipe mills has continued to increase, particularly in standard pipe and oil country goods. In the latter, the increase will hardly be held as winter would naturally bring lighter demand. At long range view demand for structural shapes has been increasing, though it is still light relative to capacity. Bars are practically stationary. Plates show a very light demand, a demand that would appear light even if there had not been such a great increase in productive capacity in the past four years. Sheets show a slight tapering off in tonnage, but still make the best showing of any of the finished steel products. Wire products are rather quiet, in keeping with the season of the year. Tin plate is in lighter demand, also reflecting seasonal conditions.

Sheet, wire, pipe and tin plate mills are all operating at 50 per cent or better, on an average, or well above the rate of steel production. Bar, shape, plate and rail mills are all at less than the general average.

Steel Price Trend

Since the early part of September it has been a conundrum whether finished steel prices as a whole were advancing or declining. There were two advances, September 12th in wire products, and a week or two later in sheets. Meanwhile list prices on tubular goods were reduced, but only by a little more than the shading previously existing. Bars, shapes and plates have been presenting the appearance of trying to advance, but without a great deal of success. Some mills advanced their prices more than a month ago, expecting others to follow, and the others probably themselves expected to follow, but only after they had booked a certain amount of business, as backlog, which business it seems now they were unable to gather together. At any rate it has been found in the past week or two that at least two important producers who had

previously stiffened up their prices are again meeting the competition. This seemed to swing the general weakening rather than strengthening. A trend in the same direction is furnished in sheets, for more than a fortnight ago the majority of independent mills advanced their asking prices a second $5 a ton and this action has not worked out into an actual advance in the market, which is easier in tone than if the attempt had not been made.

Thus a careful scrutiny of actual facts in the market indicates that if there is any trend in steel prices it is downward. Added to this are two theoretical considerations, involving freight rates and the Steel Corporation's earnings statement for the September quarter. Everything is up in the air as to what will occur with freight rates, and a wide variety of guesses is being made, but the steel buying public is likely to count upon rates being reduced at some time, expecting therefore that mills will be able to reduce prices somewhat on account of reduced costs.

Steel Corporation Report

The Steel Corporation's report is very important since it shows that even with a very light operation and existing freight rates and wage rates it is possible to make money in steel production. That is contrary to what was being said in the steel market during the quarter now reported upon. It was claimed that the steel mills generally were losing money, and as to some of them it was claimed that the more tonnage they made the more they would lose. The Steel Corporation report gives the lie to such statements, in general. Various efforts have been made to explain away the showing. Analysis would show that these explanations do not hold water, but it is not worth while to go into details. The Steel Corporation's earnings, after payment of interest on bonds of the subsidiary companies, were: July $5,157,395; August $6,502,976; September, $7,257,687; total $18,918,058. This took care of all charges down to the preferred dividend, paying nine-tenths of that and leaving the other tenth and all the common dividend to be paid from surplus. Shipments, in proportion to capacity, were approximately 25 per cent. in July, 30 per cent. in August and 34 per cent. in September. Prices declined, chiefly in the first half of the quarter, while there was a general wage reduction August 29. September is therefore to be taken for comparative purposes. The earnings in that month were about $15.75 per ton. In 1912 and 1913, which were considered fairly good years for both the Steel Corporation and the independents, the corporation, with an operation of 88 to 90 per cent., instead of 34 per cent., showed earnings averaging slightly under $10 per ton, instead of over $15. With a fair operating rate the cost per ton would be less and the profit per ton greater, producing very good earnings.

Nearly two years ago, when the independents began advancing their prices above the Steel Corporation level, claims were made that the Steel Corporation had "advantages" over the independents, so that the independents could not "afford" to sell at as low prices as the corporation. Talk of this sort still survives. It is on record, however, that the independents had fairly satisfactory earnings in 1912 and 1913, when the Steel Corporation showed earnings of less than $10 a ton, so that the difference could not be great, in dollars per ton.

If the independents cannot make profits at prices that give the Steel Corporation more than $15 a ton something must have gone wrong with the independents since 1913. The Steel Corporation has not particularly changed its manufacturing position. When the independents were getting fancy prices they probably acquired expensive habits which they have not altogether shaken off yet, and they probably failed in some cases to write enough off inventory and make other adjustments in 1920, as the Steel Corporation did. Losses now reported are probably due to these factors, which are of only temporary application. It should be noted the the Bethlehem Steel Company, unlike some independents, showed good profits for the September quarter, enough to pay the dividends. It is plain that with a reasonably fair steel mill operation it will be possible to reduce prices farther and still leave earnings.

POINTS IN WEEK'S MARKETING NOTES

The demand on the steel mills has tapered off somewhat during the past week. The rate of steel ingot production is close to the 40 per cent. mark.

Structural shapes have been showing a slight increase, but are still light when compared to possible capacity. Bars and plates are both very light, and steels show the best of all finished steel products, although even this demand is nothing to brag about.

The movement of prices recently has got one guessing, for some commodities go up, while others again ease off a little, it would indicate that if there is any trend in steel prices, it is downward.

The Steel Corporation's report shows that it is possible, even with a very light operation and present freight rates, to make money in steel production. This, in spite of the fact that such a condition has been said to be out of the question.

Montreal reports much quieter business in all lines. Even with this condition, business is much better than it was in midsummer. Further rail orders are looked for in this field in the near future.

Both Montreal and Toronto markets report a quiet machine tool market. Enquiries are coming in all right, but whether they will actually develop into orders, is another question. The coming election is said to be partly responsible for the existing lull. Everybody is sitting tight until December. 7th, when we will all know how things stand.

The small tool market is the healthy member of the market. Although business is not what could be termed brisk, it is steady, and in fact has been so for the past three or four months. Dealers in this line are quite satisfied and they feel that conditions will improve as time goes on.

LIGHT DEMAND ON TORONTO MARKET

Demand in Various Lines is Light; Elections Seem to Have Exerted Influence In Buying—Small Tools Are Steady—Scrap Market Dull

TORONTO, November 3rd:—There is no question but that the demand on this market has eased off during the past week. Although at isolated points we hear of a "good" month, we know that the reason October was a "good" month, was because the previous month, September was very poor. The first two or three weeks of October were really better than the one just passed, and in many cases, the coming election is being blamed for existing conditions. Lest this may seem to be theory, rather than actual fact, we quote the following story, as one machine tool dealer told it to us.

"We have been chasing up a certain prospect," said this dealer, "and had reached the point where he was convinced we had the only machines which would suit his purpose. The price was right, and everything looked rosy, yet we couldn't close the deal. 'Would you mind telling us why you won't sign the order,' we enquired, and here was his reply. 'The machines are just what we want, but we cannot afford to take a chance on purchasing until after the present election. If protection goes through all right, we buy the machines, but if the free traders get into power, well we will have to turn the key in our shop, and go back where we came from, namely, the United States.' Can you blame us," finished this dealer, "for wishing it was all settled, so that we could get firms to purchase with confidence?" Although this tale concerns the machine tool section of the market, the same condition holds equally true in the other lines.

One good thing about the present lull is this. Dealers are still confident that there is business to be got, and that it is a question of patience until the people of the country have decided which party they want in power at Ottawa. Dealers believe that after that date things will pick up slowly but steadily.

Speaking to one of the foremost scrap metal men this week, we asked this question, "When on earth do you expect things to pick up?" and this was the answer we received, "I wish I knew." This dealer then went on to say that this has been the longest stretch of inactivity that he would care to see again in a decade. "The little spurt we did have didn't last long," remarked this gentleman, "and from present outlook, I cannot hold out any hopes until after the middle of December." It would appear that this market will stay very weak until foundries see enough business ahead to order metal with confidence that prices are going to stay steady.

The Steel Market

Outside of a seasonable demand in sheets, the steel market locally shows no change. In fact the activity in sheets is to be expected, for everybody is anxious to finish up their buildings before the cold weather sets in. Prices are the same as last week, and about the best way to describe this section of the market would be to say that it is fairly steady.

The machine tool market is very erratic. Some dealers report good sales for October, while others again say it has been a very poor month. It's the old story of prospects breaking at different times. One month, a certain class of dealers close with their clients, while the other section is working theirs up to the buying point. One thing however exists of which there can be no doubt, and that is "competition." Every dealer is on his toes and is continually on the lookout for business. For example, three men came to Toronto during the past week on a machine tool shopping tour. Their wants were by no means exceptionally large, yet they were much better than the usual line of business these days. The result was that these gentlemen found themselves in the peculiar position of having all sorts of things to pick and choose from. After considerable deep thought, they picked a tool here and there, with the result that many dealers got a slight nibble at the order. No doubt a sigh of relief went up all around when the deal was completed, for shading of prices was the regular, rather than the occasional thing. As one dealer said recently, "If people only realized, now is the time to buy, for we are willing to talk prices and terms, which it is doubtful if we ever will again."

The small tool market remains very steady. Orders come in regularly, and while not large, if considered singly, they make a nice item when totaled up. If a graph were drawn of this market for the past six months, the quantity of goods sold each month would be found to be very nearly the same.

Although the week's activities show an easing off, there is still plenty of confidence amongst dealers themselves. They feel that things have passed the worst, and once let the election get out of the way, then business will pick up considerably.

QUIETER CONDITION EXISTS ON MARKET—SMALL TOOLS STEADY

MONTREAL, November 3rd: — Analyzing the reports from various quarters of the iron and steel industry, the unmistakable conclusion that business is distinctly quieter, is reached. Throughout September and October there was a distinct improvement in all lines, but evidently this small revival has run its course. Manufacturers and jobbers, in many cases, do not express surprise at such a turn of affairs. Even with the quieter condition, conditions are considerably improved over those existing at midsummer, showing the net result of the whole to be a gain. These temporary periods of activity followed by quieter periods are what we must expect, and as long as the net results are gains, a healthy condition is exhibited. The present time is not ripe for a general wave of prosperity. Artificial inflation of prices has not been entirely eliminated, labor wage scales have not been adjusted to their proper level, and while these and many other unsound economic conditions exist, business along general lines cannot enter upon an extended period of prosperity.

The Steel Market

Prices of steel have not altered since last week. Business has dropped back a little, and the firmness in price in evidence for some time back has not been productive of any results. The rail orders announced last week will keep the mills busy till the end of the year. The C. P. R. rail orders given to the Algoma Steel Corporation enabled that firm to put on a double shift last week, which factor will allow them to produce the steel at a lower cost. It is expected by the local representatives of the steel mills that the National Railways will be in the market for more rails before the end of the year. The amount is estimated to be about 50,000 tons. The steel men are making every effort to get the order booked. At the same time a few inquiries for structural shapes are coming in and this end of the business is receiving considerable attention from steel salesmen. Building, locally, during the past season, has not been so dull as has evidently been reported. Plans for 1922 are such as to lead the steel fraternity to look forward to much better business.

Steel bars are very quiet. The situation surrounding this end of the business has altered but little since midsummer. The sale of a few odd bars here and there, represents about all the trading that exists. There are but few inquiries. The sheet and plate market enjoys a little activity. The improvement in sheets, due to the seasonable autumn demand, has lapsed again. Plates of the lighter varieties are moving fairly well in small lots, while the prices keep firm.

Pig Iron

The volume of business turned for the six weeks following September first was extremely encouraging to producers. For the last two weeks sales have fallen off very appreciably. Dealers report that the conditions in foundries today are rather varying. Some foundries are closed, while others are running from day to day on small orders. Other shops are showing some very resourceful methods in keeping their employees busy. One foundry in this locality had six moulders laying a cement driveway into the plant next door and thus these men were enabled to get a week's employment, during which time the foundry landed a fair sized order which brought them back in the molding shop and caused a car of pig iron to be ordered by wire. This little incident about represents the condition of a large number of small foundries around this locality. The larger firms who usually buy pig in lots of from eight to twelve cars, now order one or two cars only and carry but a small stock in the yard. Prices have not changed and are not likely to until the demand increases considerably.

Machine Tools

It is very hard to accurately sum up the situation locally. A few scattered orders are being received from time to time. Most shops are pretty well equipped with standard types of tools and will not probably be in the market for some time as the present volume of business passing leaves quite a quantity of idle equipment. Secondhand rebuilt tools continue to move fairly well. The machine shop purchasing agent is not greatly interested in machine tools in general but he is keenly alive to any new equipment that promises to show up some labor saving device.

The small volume of traffic on the railways has resulted in a large quantity of idle rolling stock, and during the lull, all this equipment has been placed in first class repair. The result is that today these railway shops are caught up with their work and are not at all interested in new equipment, as, the lessened amount of general wear and tear calling for repairs can be taken care of with a reduced staff of men which results in idle machine shop equipment.

Small Tools and Supplies

Probably the healthiest department of the metal trades is the small tool and supply business. Liquidation, the great evil of the last few years, has gradually disappeared. The manufacturers are stocking up the jobbers, price lists are again a medium through which business is transacted, and the shops are buying in a reasonably acceptable way. True

(Continued on Page 66)

PERSONAL AND TRADE NOTES

INDUSTRIAL NEWS

Machine and Foundries, Ltd., Brockville, are developing a line of hardware specialties, chief among which are hand pumps of different types.

Smiths Falls Malleable Castings, Ltd report considerable improvement in raway demand. They recently found it neccessary to increase their foundry force.

H. George, managing director of The Hans Renold Co., of Canada, left Montreal on October 28th, on the C. P. R. Steamship Minnedosa for England. He will be gone 6 weeks.

The Stirling Trunk Co., of New York, are locating a Canadian factory in Toronto. They have leased space at 510 King St., E. for the present. It is intended to erect a large plant of their own here at a later date.

The Riordon Company announce the re-opening of their sulphide plant at Kipawa. This plant has been closed since April last. About 400 men will be taken on at once.

Toronto Relators report many enquiries for business sites from British and U. S. concerns. This undoubtedly is but the forerunner of announcements of new plants locating in Toronto in the near future.

The William Hamilton Co., Peterborough, are building four 56-inch turbines for the Canadian Electric Co. These will be installed in a new plant on the east side of the Otonabee River at Nassau, above Peterborough. A new government dam is being erected there.

The Otley-Simpson Co., of Otley, Yorkshire, have decided to establish a Canadian factory. The location has not yet been announced other than it will be in Ontario. This firm manufactures cheese and meat presses drain excavators and other special equipment.

Mr. Ernest Sumner, president of Sumner and Co., New York, agents for an English manufacturer of belting has just completed a visit to his eastern Canadian representative in Montreal. Mr Sumner states that business conditions in the Eastern states are improving slightly. and he expects that spring will bring business back to normal.

The Dominion Engineering Works Lachine, announce that contracts have been recently placed with them by the Montreal Water Works calling for three thirty-million gallon pumps, twelve 36 inch Johnson combined stop and check valves, and six 42 inch gate valves, this latter being a line which this company has recently taken over. This is for Montreal's new low level pumping station.

A. Cotton, George St. and River Road South, Vancouver, B. C. is erecting a saw-mill.

The erection of a manufacturing plant is contemplated at Grimsby, Ont., by the Grimsby Steel Furniture Co., Limited.

The Sifman Shoe Manufacturing Co., Aurora, Ontario, is erecting an addition to their building of offices at the cost of $25,000.

The ratepayers of the city of London, Ontario, will shortly vote on a by-law authorizing the expenditure of $150,000 on the construction of a dam.

Cobourg, Ont.,—Both the Cobourg and Port Hope plants of the Cobourg Felt Company are running with a large staff, and a good season for this industry is fully expected.

The new building of the Loyal True Blue and Orange Orphanage which is now being erected at Toronto will cost about $197,000.

Ross Meaghen Co., have been given the contract for the excavation and foundation work on the new Collegiate to be erected at Ottawa.

Fire damaged the plant of the Blue-Bird Corporation Brantford, Ont., manufacturers of washing machines. It is estimated that the damage will amount to around $10,000.

Roy M. Wolvin, president of the British Empire Steel Corporation, says that there is a chance of the coal mines of Nova Scotia closing this winter, if the miners refuse to accept a lower scale of wages.

The Provincial Government is going to make a grant of $7,225 for a steel bridge over the Salmon river at Ascot. The Sherbrooke County Council are interested.

The Ingersoll Machine Tool Co., are going into the manufacture of ironing machines for household use. Their sales office is located at 80 Bay St., Toronto.

Redfield & Fisher, Inc., New York state that George H. Wallace, formerly a director of Hoyt's Service Inc., is now a member of their firm, which will now be known as Redfield, Fisher & Wallace, Inc.

Both the Cobourg and Port Hope plants of the Cobourg Felt Co.. are now running with a large staff, and a good season for this industry is expected.

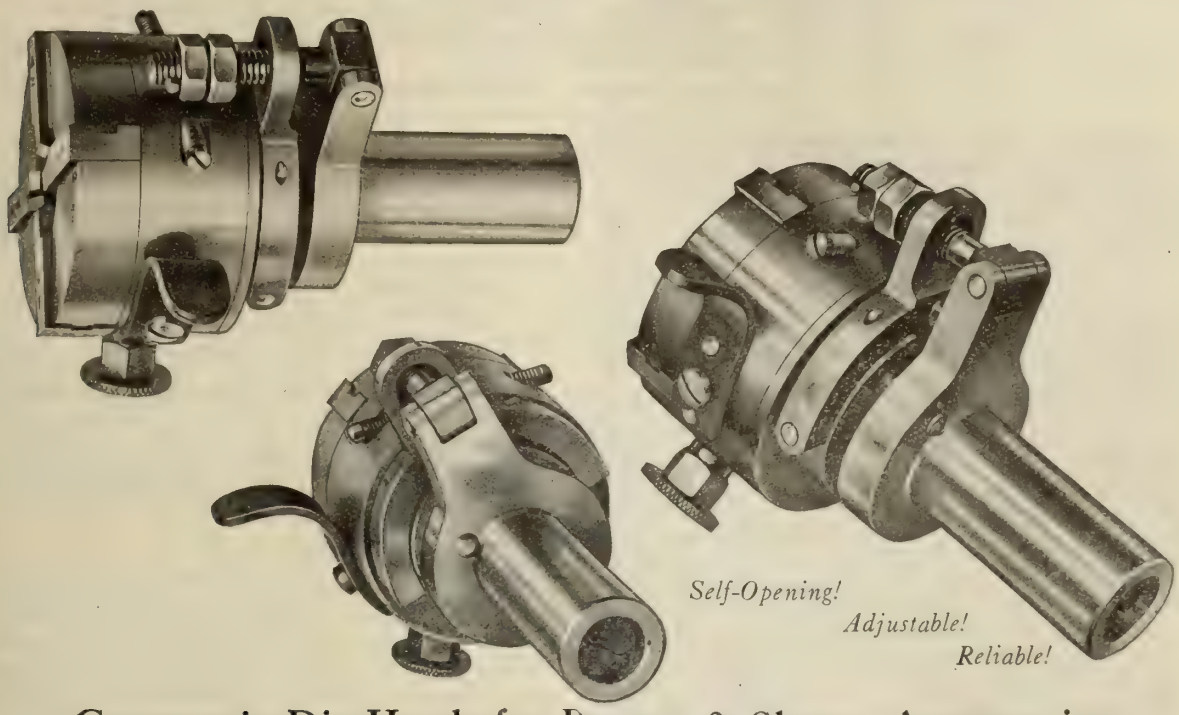
A ten story addition to the Crawford House, Windsor, Ontario, is proposed. Plans have been prepared for an addition containing 112 guest rooms and will cost about $400,000.

J. N. Coupal, Plantagenet Springs, Ontario, contemplates the erection of a Flour Mill at Lebret, Sask., with an electric light and power plant costing $200,000.

The National Railways have placed an order with the Canadian Car Co., for the repair of 1,000 cars. 500 of these will be handled at the Amherst plant, and the same number in Montreal. This work will give employment to a large number of men at both plants.

Canada's Furniture Manufacturers are experiencing a greater measure of activities than earlier in the year. The latest data, based on a complete survey of the industry, showed that production averages 65% of normal.

A site has been purchased at Amherstburg, Ont., by the Midwestern Tractor Wheel Co. that will be used in the establishment of a Canadian branch plant. The organization is capitalized at $1,000,000 and is controlled by Detroit financiers. The site consists of 72¾ acres.



The Canadian export of pulp and paper shows an increase to the value of $51,633 over the month of August this year. Exports of newsprint for the month of September amounted to 1,224,136 cwts. Comparing this with 1,212,225 cwt. in the corresponding month last year is shows a substantial increase of 11,911 cwt. This is an equivalent of 595 tons.

In Chicago a few days ago Mr. James A. Yates, assistant treasurer of the Grand Trunk railway system, was elected second vice-president of the railway treasurers' association. The election of officers took place at the annual convention. For some years past Mr. Yates has been very prominent in the deliberations of the association.

A record in long distance travel in Great Britain has been established by a new through service between Penzance and Aberdeen. The length of the journey is 785 miles, and the scheduled time for the run is less than twenty-four hours, including one stop of thirty-five minutes at Edinburgh.

Right on the Lead

A New High Mark in Screw Cutting

Geometric Die Heads for Brown & Sharpe Automatics and Other Single Spindles

DESIGNED primarily for the Brown & Sharpe Automatic Screw Machines, the D. S. Die Heads are quite as well adapted to other Automatics, and where they are used, there is no reversing of the spindle to back the Die Head off the threaded work.

Note the lever trip, which reduces the force of tripping the Die Head and lightens accordingly the reaction on the threads being cut.

Buffer Springs allow the Die Head to yield slightly when the Chasers come in contact with the work, insuring a good smooth thread from the start.

Shock and wear are eliminated by the spring closing attachment. This is of special value when closing the Die Head rapidly.

Push Buttons eliminate all trouble in inserting the Chasers.

No face plate is necessary, making it possible to use projecting Chasers where required for cutting close to a shoulder.

The Closing Attachment is located in a convenient position to strike a stop on the machine, which automatically closes the Die Head when the turret revolves.

The Chasers are of sturdy construction. They have long bearings in the Die Head skeleton and are supported by hardened keys, which prevent tilting and consequent cutting of taper threads.

The Die Heads are provided with shanks to fit the particular size machine on which they are to be used.

Consider the economy of using one of these Die Heads with its Micrometer Adjustment, over a button die, which has no adjustment.

Geometric Die Heads are sent out on trial to reliable concerns.

THE GEOMETRIC TOOL COMPANY
NEW HAVEN CONNECTICUT

Canadian Agents:

Williams & Wilson, Ltd., Montreal. **The A. R. Williams Machinery Co., Ltd., Toronto, St. John, N.B., Halifax, N.S.**

INDUSTRIAL NEWS

Theo Amodeo, 1216 St. Clair West, Toronto, Ontario, will build a garage and service station at the cost of $45.-000.

Additional Contracts for the Prince Edward Hotel, Windsor, Ontario, costing $1,000,000 for the border city Hotel Co., have been granted.

A reinforced steel contract for addition to warehouse costing $95,000 for J. R. Watkins Co., 90 Annabella St., Winnipeg, Manitoba, has been placed.

The representative of one large motor car concern in Toronto recently stated that his company had shipped more motor vehicles to China in the past six months than to any other country in the world.

Some six weeks ago the St. George Pulp and Paper Mills at St. George, N. B. were forced to close down owing to low water. The company, which is a New York concern, resumed operations recently.

Mr. Leitch, advertising manager of the Merchants Bank of Canada, states that it is the opinion of the banking fraternity in general that business is on the turn and that we are now on the upgrade.

The leather industry is picking up. A large firm in this industry situated in Toronto has stated that their business for the month of October 1921 would be three times as large as it was in January of the same year. In some standard lines manufacturing operations are running practically under nomal basis

W. S. Duffield of the John McPherson Shoe Co., Hamilton, Ontario, stated that during the past month there has been a considerable increase in business, and nearly all orders were wanted at once. The firm is employing more hands than it has been for months.

In the Oct. 13th issue we stated that the F. F. Barber Co., had completed arrangements for the exclusive Canadian representation of the Warner & Swasey Co., Cleveland, Ohio. This report was incorrect, and what we intended to say was exclusive Ontario representation and not Canadian.

The Canadian-Mead-Morrison Co., of Montreal report that their general manager of the American and Canadian companies states he has found things very much improved in the Western United States, and that their Boston factory is now fairly busy, a condition which should have some reaction here later on.

The City of Hull, Quebec, is altogether likely to secure a new industry, that of specialty motor car manufacturing, which is backed by a syndicate of Montreal and Toronto interests, and is capitalized at $250,000. Announcement to this effect has been made by Mr. St. Jean, secretary of the Hull Publicity Commission, who stated that an option has been secured on a large tract of property in that city.

Owen Sound. It is understood that about $15,000 will be spent in repairing the breakwater at the harbor entrance which has fallen into disrepair. The department of Marine and Fisheries of the Dominion Government is said to be taking up the work which will be done by day work.

Darling Brothers of Montreal have secured the contract for the construction of six freight elevators to be installed in the old Montreal jail which is being renovated by the Quebec Liquor commission, acting for the Provincial Government. The total cost of the renovation contracted for amounts to $1,000,000 and when renovated the building will be used for the storing of liquor.

Mr. Breen Kennedy, Canadian manager of Wm. Beardmore & Co., of Scotland, leaves for England early in November on a business trip to investigate industrial conditions over there, and also to arrange several matters in connection with their representation in Canada. Mr. Kennedy states that business conditions in this country are steadily improving. This is indicated by the number of enquiries he has had with regard to their products.

Two representatives from Sweden who have arrived in Halifax, Nova Scotia, are here to establish trade relations between Canada and Sweden particularly to buy food products for Scandinavian consumption. They are prepared to export from Nova Scotia large quantities of wheat and other grain, fresh fruit, etc. From Montreal they aim to ship wheat and rye, and from Ontario canned and fresh fruit, and other food products from points right out to the Pacific.

Among the bright spots that are working to the surface in these strenuous days. Port Hope supplies a valuable example. The Matthews Gravity Co., who come in contact with a wide range of industries report a decided improvement, and have found it necessary to double their force. They are now running a full week of forty-four hours. That there seems to be every reason for confidence that better times are coming, is the opinion of the management.

The James Smart Manufacturing Co., Brockville, are practically running full time. In fact part of the plant, engaged in production of school desks is running overtime, owing to demand created by erection of new school buildings all over the country. Hardware demands have also taken on a spurt, due in many cases to the fact that stocks are very low. This is not the time of year when such demand is in evidence, and the condition would seem to assume exceptional business when the spring season opens.

Some weeks ago Canadian Machinery gave a description of the new low level pumping station at Point St. Charles, Montreal. The three, 30 million gallon pumps that are to be installed in the pumping station will be built by the Dominion Engineering Works, Rockfield, P. Q. The price to be paid by the Montreal water board for three direct connected pumping units is $76,000. Westinghouse motors will be used. The I. P. Morris type of pump will be supplied, these being built under licence by the local firm.

It is understood that in addition to the segment castings required for the vehicular tunnel to be constructed under the Hudson, some 4,000 tons of 1¾ in. bolts with nuts and washers; 12,000 tons of structural steel, 3,000 of reinforcing bars, and 1,000 to 2,000 tons of cast iron, wrought iron and steel pipe will be needed. Specifications will be printed sometime in November, and bids will be advertised later on.

Six hundred and twentyone thousand feet of lumber was unloaded at the docks of Meaford a few days ago for the Seaman-Kent Flooring company. This factory has been working overtime, and is receiving rush orders from the west, which furnish excellent business for the concern. The overtime will continue for the next three or four weeks.

Harry Bourne, of Hamilton, has been appointed a foundry inspector for Ontario, by the provincial department of labor. Mr. Bourne is an experienced molder, having worked at the trade for about 20 years. For many years he was secretary of the local Molders' union, and has filled the office of president of both the Hamilton trades and labor council and the Independent Labor party.

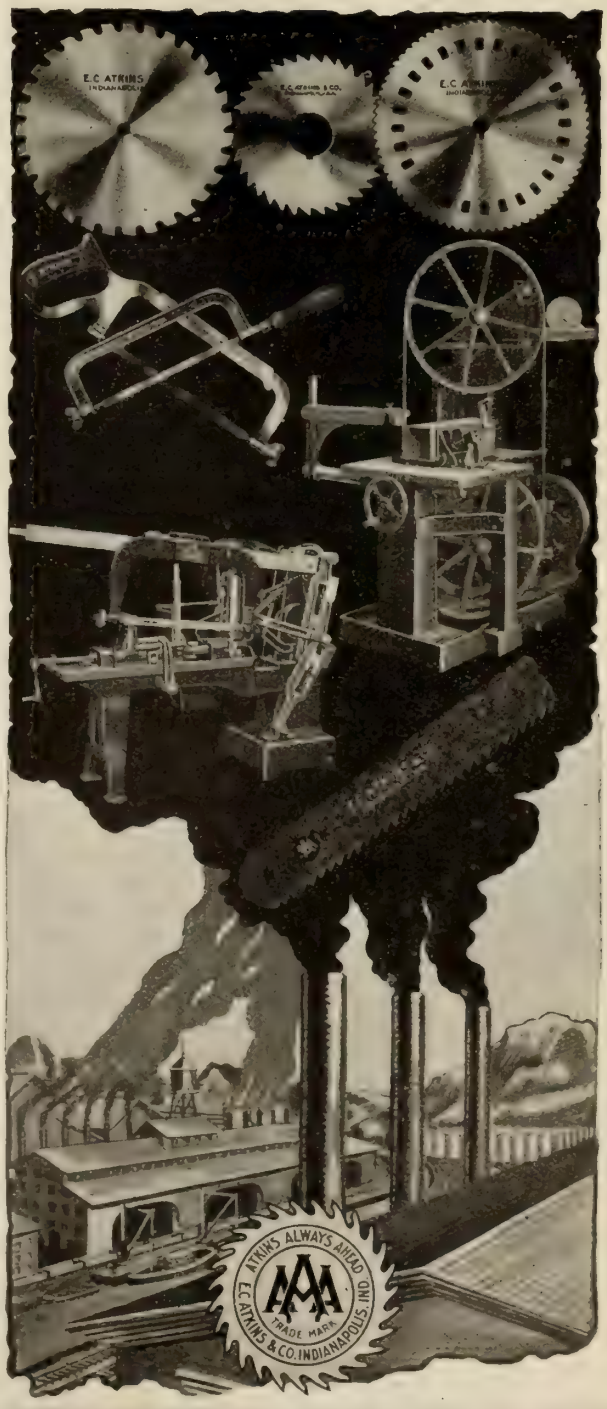
The International Wheel and Rim Corporation have secured their Dominion Charter and will shortly have this branch organized. Mr. George Crennan of Cleveland, Ohio, is president and general manager of the Canadian branch and in an interview with this paper stated that he had already secured a draft of orders sufficient to keep their plant going for one year. Mr. Crenan's present address is 504 Sherbourne St., Toronto. Offices will be opened in this city in a few days.

The Watkins Manufacturing Co., of Kansas, will establish a Canadian plant on Rideau Street, Kingston, Ont. The company is engaged in re-babbitting worn out bearings of machines, automobiles and tractors. They receive from garages the worn out bearings and remake them instead of allowing them to be termed scrap. Mr. John M. Hughes, ex-mayor of Kingston has been appointed general manager for the Canadian plant.

Reports from many centres in Canada show that building is not as inactive as some would have us believe. Figures which we have secured show that in the province of Quebec alone for a period of nine months commencing January 1st, 1921, the total value of all permits issued was $2,686,874, a larger sum than any other full year with the exception of 1914. The entire year of 1914 however, was only $72,000 ahead of the total of the first nine months of 1921, therefore if we keep up at the present rate, this year will be a record one.

ATKINS METAL CUTTING SAWS

Present Conditions



Don't let present-day conditions worry you; everything is fundamentally sound. More economy is being called for, use

Atkins Metal Cutting Saws

Conditions are such that quality and quantity production is essential. The use of Atkins AAA Non-Breakable Hack Saw Blade and Frames, Circular Metal and Slitting Saws, Hot Saws, Cold Saws, Kwik-Kut Hack Saw Machines and Blades and Metal Band Saw Machines, will assure you of efficient, economical operation and give you quality and quantity production.

INDUSTRIAL NEWS

Toronto:—Tenders are being asked by the board of education for Technical School equipment. These must be sealed and addressed to the business administrator and secretary treasurer, board of education, 155 College St., and will be received until Friday noon November 4th. Following is the equipment required: 20 engine lathes and equipment, 1 speed lathe and equipment, 1 hack saw, 1 grinder, 1 drill, 2 motors and small tools.

The United Steel Corporation of India, hope to make a good showing in the steel industry. It is understood that a high quality of iron ore and excellent coking coal have been found close together in the provinces of Bihar and Orissa. As the cost of erecting works in India is considerably below that in other countries it is believed India is capable of producing the cheapest steel in the world. The plant, which will be erected by the Cammell, Laird Company will be capable of producing 750,000 tons of pig iron and 500,000 tons of finished steel annually.

The experimental plant erected by the Dominion, Manitoba, and Saskatchewan Governments, at Bienfait, Sask., for the briquetting of the lignite coals found in that district is ready to commence operations. The plant, erected at a cost of $780,000, half of which was supplied by the Dominion Government, the other half being shared equally by the Saskatchewan and Manitoba Governments, has a capacity of 30,000 tons per annum. It is believed that briquettes turned out by the plant will have heating values comparing favorably with hard coal, and will be placed on the market at about $10 per ton.

The contract for alterations and additions to the recently purchased plant of Durant Motors of Canada, Limited, at Leaside has been let to E. C. Warren, constructing engineer. Work will be started immediately with a view to having the plant ready for the manufacture of automobiles not later than March 1, 1922. Mr. Warren will establish an office at the Leaside plant and take personal charge of the work. Contrary to published reports, Mr. Durant says it is the company's plan to have all of the parts entering into the building of the new Durant car made in Canada, including tires and electrical equipment. Motors for the Durant will be brought from the States until the plans of the Continental Motors Company to establish a Canadian plant are completed.

C. G. Porter & Co., have opened up an office in the New Birks building, Montreal and announce that they have taken over the following agencies, which up to the present have been handled by the Douglas Milligan Co., Ltd., which firm is now in voluntary liquidation: Canadian David E. Kennedy, manufacturers of Cork and Everlastic tile. Canadian Jewett Refrigerator Co., manfacturers. Canadian MacArthur Concrete Pile Co., contractors for general foundations and the installation of the MacArthur pedestal pile and the MacArthur straight pile. The Custodis Canadian Chimney Co., designers of chimneys, and erectors of radial brick chimneys. The Keystone Fireproofing Co. of Canada, installers of the metropolitan system of fireproof construction, and erectors of gypsum blocks. The Reliance-Grant Elevator Corporation, manufacturers of "Reliance & Diamond" hangers; elevator door controllers; door lock, and ball bearing drawer slides. R. Guastavino Co., installers of vault and arch constructions, and manufacturers and installers of Rumford tile.

These are strenuous days for the lumbering industry, according to reports from Ottawa, referring to conditions among the large mills in that city and vicinity. Practically all of these are at a standstill. There are very large stocks an hand and the tough part of it is these represent an outlay far beyond any return possible at to-day's prices. In fact it is reported that one large concern has something like fifty million feet on hand and that is was recently offered to the market at something like $18 a thousand. This quantity of lumber represents a tremendous amount of money and it is not surprising that owners are inclined, if not compelled, to make heavy sacrifices in order to liquidate. It is not so long ago that lumber was as high as $65 a thousand. Pattern lumber is still at a pretty fair level. One foundry reports that they recently made a quantity purchase at $72 per thousand but that they had paid as high as $110.

Kayer Ellison Company, 126 Craig Street, West, Montreal, representing the steel manufacturer of that name report that since Armistice they have added to the actual number of their customers by 100 per cent. They have not, of course, increased the volume of sales proportionately owing to conditions over which they have no control. It is highly significant, however, that this concern should have been able to accomplish what they have during a period when there was so much inertia to overcome. They explain the result by the fact that they have not weakened their oganization but on the contrary have strengthened it, bringing their sales force up to a high state of efficiency by the introduction of new blood wherever needed and by getting out of the routine in the search for new firms to add to their list in order that with improved conditions they would be ready in every department to take advantage of them as they now are.

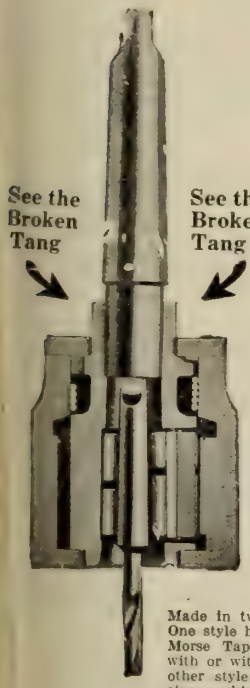
The Canadian Locomotive Co., Kingston, are all set for a strong start in the industrial getaway. The plant has been practically shut down since May, but in the meantime all equipment has been completely overhauled and repainted, then a two-pit extension to erecting section and a new wing 65x185 feet, with travelling crane, has been added at a cost of something like $110,000. This building will, for the present, be used for storage purposes but is so constructed that it may be immediately converted for manufacturing purposes if necessary. There are also two small additions to be used as tool, logging and bolt rooms, also a new forging furnace, and an extra tire machine has been installed. Under normal conditions this plant employs from 800 to 900 men. The recent building and overhauling operations have given work to a small force of foremen and other employees. It is the feeling of the management that the railways cannot much longer remain out of the market for new equipment, and that when the demand does develop, it should come with considerable volume. The plant was never in better condition and in its preparedness indicates every confidence in the future.

MARINE NEWS

One of the largest dredges in the world is now nearing completion at the yards of the Canadian Vickers, Ltd., Montreal, and is expected to be handed over to her owners, the Department of Marine and Fisheries, in about three weeks. It will probably be operated on the ship channel below Quebec, and will leave for that port immediately on delivery. The dredge is 284 feet long between perpendiculars, and 292 feet long over all, with a breadth of 48 feet and a depth of 20½ feet.
akoustolith tile.

M. Campbell, president of the Kingston Navigation Co., who has had the steamers St. Lawrence and Brockville plying on the river and lake routes, has under consideration extensive plans for improving the service for next season. The steamer St. Lawerence is to be extensively overhauled this winter, with a view to increasing her efficiency as a passenger steamer. The steamer Brockville will continue on her route, taking in Picton and Belleville and intermediate points, as long as the water is open. Her freight business is very heavy at present.

OBITUARY



The recent death of Lieut-Col. Senator Frederic Nicholls, will be felt by many industrial circles, for Mr. Nicholls was well known amongst mechanical men. He was born in England in 1856 educated at Stuttgart, Wurtemburg Germany, and came to Canada in 1874 He lived for a short time in Montreal then moved to Ottawa. Later he moved to Toronto, taking a position as reporter. After this he became secretary of the Canadian Manufacurers' Asscciation which then was assuming an important position in Canada, following the inauguration of the national policy in 1879. He also was responsible for the start of the paper called "The Canadian Manufacturer," and was with this perodica until about 1893. Then came his entr into electrical business. Together wit others, he developed the Canadian Gen eral Electric Co., with a capital of $18

Good Mechanics and Good Tools Get To-gether at--

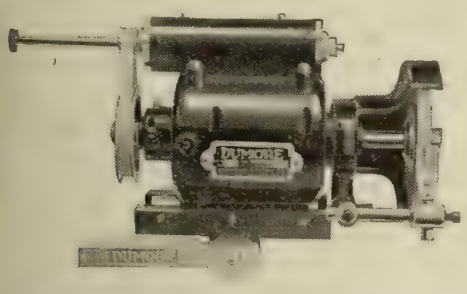
In order to satisfy the most men with the best tools a "high quality" standard is essential.

Aikenhead's

The reliability of our supplies can be tested by one unfailing way. Ask your friends!

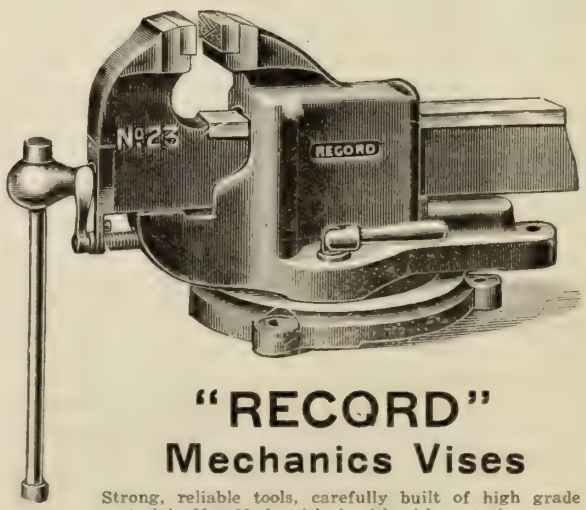
Made in two different styles. One style holds No. 1, 2 & 3 Morse Taper Shank Drills—with or without a tang. The other style is made in three sizes, which hold all sized straight shank tools from ¼ to 1 inch.

WAHLSTROM
Automatic Drill Chuck



Even such a small article as a chuck can waste or save a surprising amount of money in the course of a year. With the WAHLSTROM **Automatic Drill Chuck** the balance is on the **savings** side.

This mechanically perfect chuck, is self-centering, fully automatic and absolutely non-slipping. It saves time and money because it works just as well with broken tangs as with good ones. The smooth, hardened and ground jaws grip on the **side** of the shank enabling the tools to be used long after the tangs have become useless.



And the WAHLSTROM Chuck conserves energy! With it the operator can make tool changes in just two seconds, without stopping the spindle of the machine. **You can use it for ten days, free.** Your name and address will bring it.

Handy — Efficient — Powerful
DUMORE Electric GRINDERS

For general tool room use and for grinding hardened tools this No. 2-A.C. DUMORE grinder is unequalled. A portable tool-post type—always on the job—with a speed of 10,000 R.P.M. and an arm speed of 30,000 R.P.M.

Equipped with universal motor, operating on either D.C. or A.C. Selected bearings. Net weight, 15½ lbs.

"RECORD"
Mechanics Vises

Strong, reliable tools, carefully built of high grade materials No. 23 furnished with either stationary or swivel base. Quick-gripping jaws. **Buy them at Aikenhead's.**

Aikenhead Hardware, Limited
17 Temperance Street, Toronto, Ont.

000,000 and assets of more than $31,000,000 although their original assets consisted of only $10,000. To speak of all the companies he helped organize would take considerable space. Sufficient to say he had many interests, and he has held some wonderful positions in his day. He was a very energetic man, brooked no rivals, and thoroughly understood his business. As J. J. Ashworth, assistant general manager of the Canadian General Electric Co. puts it, "No one had a better grasp of the details of the manufacturing enterprises than he. Particularly was this true of everything that related to the C.G.E. The commercial life of the country will greatly miss his efforts in this direction. In his social relationships he was one of the most human of men and in all his business affairs strictly just."

James Cant, Superintendent of the Wallace Shipyards in Vancouver died a few days ago of heart disease. He was born in Dundee, Scotland, 54 years ago, and was for years manager of the Caledonian Shipbuilding Company. He came to Canada in 1912 to take charge at the Wallace yards.

Sir John Kennedy died in Montreal a few days ago in his 84th year. Sir John had been prominently connected with the Port of Montreal since 1875. He graduated from McGill University sixty years ago and later became Chief Engineer of the Great Western Railway and resigned from that position in 1875. It was then that the deepening of the St. Lawrence ship chnnel to 24 feet was determined upon, and as soon as the necessary legislation was obtained, the management of the work, as well as that connected with the Montreal harbor enlargement, was put into his hands, with the title of chief engineer. The method of deepening advised by Mr. Kennedy as being the most advantageous to the shipping trade of the harbor was adopted for that and all subsequent deepenings of the ship channel carried out by the harbor commissioners. In 1888 Mr. Kennedy prepared the plans for the harbor enlargement which is practically responsible for the present up-to-date harbor enlargement which are practically was commenced in 1890, and by 1906 the harbor, as it is to-day was clearly outlined.

In 1907 Mr. Kennedy's eyesight failed him and he resigned as chief engineer, but was appointed consulting engineer, a position which he held until his death. The services which he rendered to Canada were recognized by knighthood in 1916. In March, 1917, the degree of L.L.D. was conferred on him by McGill, and in May of this year that of D.C.L. was conferred by McMaster University, Toronto. Up to a month ago he was a daily visitor at the offices of the harbor commissioners. He served on several Royal commissions. Among them were, the one in 1886 inquiring into the leasing of water power on the Lachine Canal; in the same year on a similar body to solve the problem of spring floods in Montreal, and in 1888 on the commission to inquire into the advisability of completing the Trent Valley Canal. He was also on the commission in 1917 which reported against the Hydro Radial system in Ontario. He was one of the ratepaying engineers who persuaded the Montreal Civic administration some years ago to abandon plans being followed for the new Montreal Aqueduct system.

He was one of the 19 founders in 1887 of the Canadian Society of Engineers, now the Engineering Institute of Canada. He was the sixth president in 1892. His interest in the Institute never diminished, and until a short time before his death he was a regular attendant at the weekly meetings. His services as an engineer and citizen were recognized by the Institute in 1907, when he was elected one of ten honorary members. He was also a member of the Institute of Civil Engineers of Great Britain, and since 1915 chairman of the advisory committee of the Council for Canada. He was a member of the American Society of Civil Engineers since 1875, and a director from 1898 to 1900.

THINKING ENGINE IS TESTED CAREFULLY

In our editorial columns this week we speak of the "thinking" locomotive. This device automatically prevents railway collisions and nearly all sorts of railway accidents. The mechanism is controlled by electricty running at a very low voltage through the rails. The railway is divided into insulated sections of suitable lengths and the locomotive is provided with an induction coil placed two inches above the tracks. This "picks up" the current which, transformed into a higher power, magnetically sustains a weight in the engine cab. This weight, if dropped, will act on the locomotive's mechanism and bring it to a standstill, But the voltage is so low that it is sufficient for only locomotives and hence if two approach each other the current becomes insufficient and the weight drops, causing first a blowing of the whistle, second the shutting off of the steam, and third, application of the brakes.

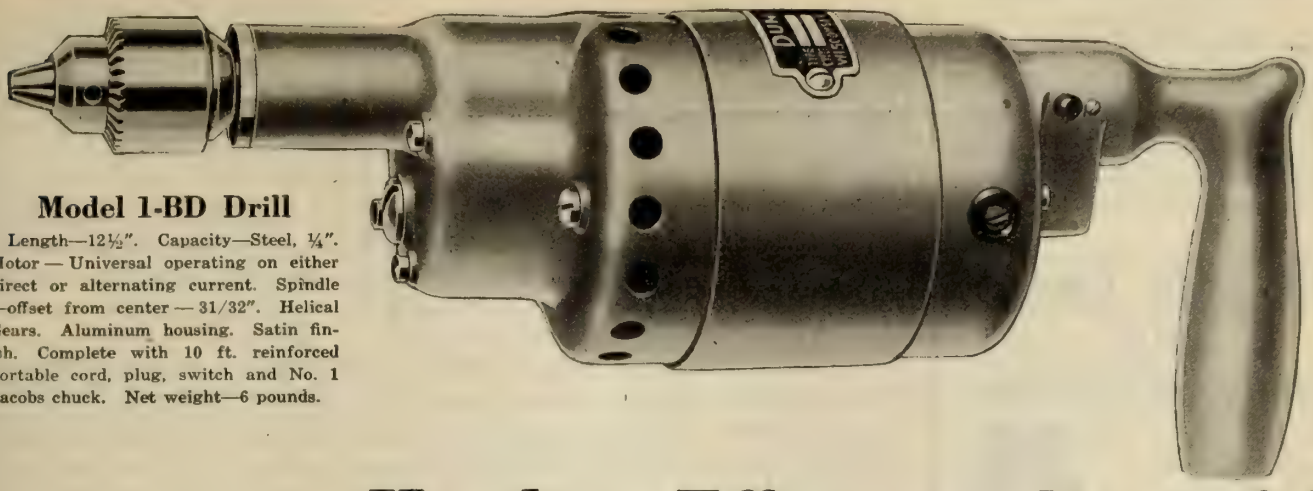
Does not Depend on Human Element

It is stated that the installation of the new system on eight lines in England will begin immediately. The system operates even if the engine driver is drunk or asleep. The human element is only on the mechanic who controls the supply of current to the locomotives, but the worst that could happen from his carelessness would be a momentary suspension of the traffic.

Mr. Angus the inventor, claims that his system will greatly increase the safety of moving traffic on congested lines. Its novelty is the absence of any "shoes," "clamps," or other mechanical contacts which it is claimed have made all previous systems unsatisfactory. Finally Mr. Angus claims that the system is very economical; in fact he purposes to install it on the English railways free of charge, taking as his profit half of the resultant saving in the operating costs.

BUSINESS MEN GIVEN GOOD ADVICE

In Mr. O'Connor's opinion, the business man of to-day is confronted with the option of sitting down to wait for the clouds to roll by, or to get up and push those clouds away." Mr. O'Connor is general manager of the Murray-Kay Co., Toronto, and the above remarks were given a few days ago in an address before the Lions' Club at Toronto. Among many other thing things he said, that manufacturers cannot put their spare money into tax free bonds, then go out and play golf or something else, and think that is going so save the situation.



"Such a plan is so ephemeral, and so obviously not the solution to any country's financial problems," remarked Mr. O'Connor, "that I am surprised that men who have built fortunes for themselves can become converts to it. Capital cannot exist in a strong box. The only place that capital can keep its life is out in the open. Nothing would be more fatal to any community than the common adoption by all who had savings of such a plan."

In Mr. O'Connors opinion, business will not be stabilized until business men can look upon each other without suspicion.

PORTLAND CEMENT

The U.S. Geological Survey, department of the interior, say that the movement of portland cement continued on a large scale throughout September, more than 11,300,000 barrels having been shipped from mills. Shipments of portland cement during the third quarter of the year were approximately 33,970,000 barrels, establishing a record for this quarter. For the nine months ending September 30, 1921, the shipments amounted to 74,045,000 barrels, which exceeds the former record volume moved in the corresponding period of 1920. Favorable operating conditions are indicated by the large September production of 10,027,000 barrels of finished cement, which established a record for that month. The average daily production was greater than that of August, and had there been as many days in September as in August the September production would have shown the larger total. Production for the third quarter likewise established a record, and for the nine months ending September 30 the production was about 99.8 per cent of the record quantity made during the period last year.

The Bureau of Foreign and Domestic Commerce, department of commerce, reports that imports of hydraulic cement in August amounted to 10,988 barrels valued at $216,892. The exports of hydraulic cement in August were 84,52[illegible] barrels valued at $3,253,463, the total exports for the eight-month period were 848,971 barrels, valued at $3,253,463.

Model 1-BD Drill

Length—12½". Capacity—Steel, ¼". Motor — Universal operating on either direct or alternating current. Spindle —offset from center — 31/32". Helical Gears. Aluminum housing. Satin finish. Complete with 10 ft. reinforced portable cord, plug, switch and No. 1 Jacobs chuck. Net weight—6 pounds.

Model 2-BD Bench Drill

Motor specifications identical with Model 1-BD.
Height—20½".
Stroke—3¼".
Rack and pinion feed.
Capacity—Steel, ¼".
Drills to center of 7⅞" piece. Ball Bearing thrust. Aluminum housing. Adjustable table. Complete with 10 ft. reinforced portable cord, switch, plug and No. 1 Jacobs chuck. Net weight 21 pounds.

Handy—Efficient—Powerful

DESIGNED by men who know the practical advantages of small, light tools that get to the spot where needed without waste of time, Dumore Drills save time, money and energy. Equipped with perfectly balanced motors, Dumore Drills are accurately built and have an almost unlimited range of usefulness. For speed and accuracy on fine and sensitive jobs Dumore Drills will supplement the work of your big machines—adding to the capacity of your shop and cutting down production costs on many classes of work.

Send for details of how you can use Dumore Drills to advantage.

SELLING GOODS TO THE JAPANESE

Speaking on the value of advertising in the markets of the Far East, M. Malabar, office of trade commissioner, Yokohama, says that the Japanese are an exceedingly artistic nation, and their attention is at once drawn to any advertisement which is such that it appeals to their artistic sense, which is indeed so strongly developed that any industrial product or article which may be brought to their attention in some journal, newspaper, magazine, poster, etc., by well-designed advertisement portraying the product will often be the means of arousing a desire to procure that article without delay. The more widely an article is advertised, the more strongly and urgently does the desire to possess it grow, as the Japanese loves to be considered progressive and "wide-awake."

The manufacturers of the United States—who thoroughly understand advertising owe a great deal of their success in Japan to their genius for advertising. Not only do they produce advertisements which immediately attract the attention of the reader in Japan because of their artistic qualities, says Mr. Malabar, but they also see that such advertisements are repeatedly brought before his eyes; and the results fully justify their efforts in this direction.

Canadian manufacturers are urged to pay more attention to this means of promoting the sales of their products in the Japanese market, and it is said that the results will fully justify the expense. The trade commissioner will be pleased to render assistance in the way of advice to any manufacturer desiring to advertise in the papers or magazines of Japan. He will be able to give information as to the best channels for each advertisement, will be able when it is necessary to have the same translated into the Japanese language (i.e., where advertisements are both verbal and pictorial), and will personally report on any interest awakened by such means.

MONTREAL LETTER

(Continued from page 55)

the volume of business is not setting any record, but it has the appearance of being of a steady, dependable nature. Prices still run considerably above the 1914 schedule, but are slowly being reduced. The railways are purchasing along these lines in fairly large quantities. It is rumored that the National Railways expect to open their repair shops at Port Arthur. This will mean large orders for small tools and supplies.

Non-Ferrous Metals

"Marking time" is a good expression to use when attempting to describe the week's business in non-ferrous metals. Prices have remained stationary and the small volume of business passing, is about the same as that of the past few weeks. The larger brass foundries are following the methods pursued by the iron foundries, and are only purchasing from "hand to mouth." This, coupled with the small volume of business presents a very colorless situation.

All lines of scrap metal markets present the usual inactivity. As has been stated in these columns many times, there is but little prospect of improvement this year and it is altogether too risky to prophesy beyond that.

PORTABLE TOOLS

Continued from page 35

er, planer, and portable horizontal boring mill. Each of the machines mentioned is self contained and is portable, yet one would find it extremely difficult to pick up such a tool and walk away with it. In many cases it is good policy to take the machine to the work, rather than the work to the machine, and an example of this is shown at Fig. 3. Here we see a portable planer cutting out tee slots in a large floor plate section. At the same time as this is going on, the portable boring mill drills the holes shown in the photograph. Each machine is self contained and motor driven, so that although heavy machines in themselves, they are nevertheless portable in the broad sense of the term.

Another small portable tool, which should be mentioned, is the die filing machine. This type of tool is especially useful in the making of armature dies, or in fact on any type of die having a peculiar shape and narrow slots. Of course, the use of such a machine is not confined to dies for it will accomplish filing on any style of work. It is chiefly used, however, on die work.

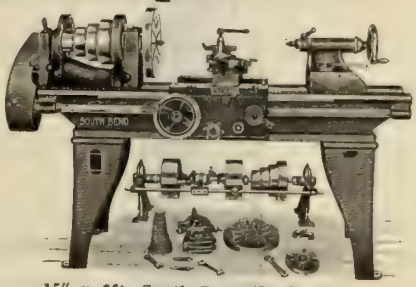
GALT, ONT.

Do Your Castings Cost Too Much?

A rearrangement of your patterns might cut their cost 25 per cent.; a different method of molding them might double your production at no increase in molding cost. We can advise you and we have expert metal and wood patternmakers who are able to make any changes that may commend themselves to you.

If you need some new Patterns

send us a sample, blueprint or sketch, and ask for our advice. It won't cost you anything. If our advice is good and commends itself to you, it is only fair to assume that our work will be equally satisfactory, and we need the work as badly as you need the patterns.



We are in a position to do turning, boring, drilling or other semi-finishing operations on castings supplied by us. **Ask us.**

We have for our and your requirements, a large stock of assorted White Iron Stars, suitable for light agricultural to medium weight machinery castings, while they last, at 8 cents per lb. F. O. B. Galt.

The New Canadian-Detroit Double-D Rolled Drill

Made in Canada

PRODUCTION requirements in an ever-increasing number of plants necessitate the use of a strong, accurate drill, specially designed for hard drop forgings, steel castings, and other alloy steels equally tough and difficult to drill.

For this service we have developed a hot rolled process drill known as the Canadian-Detroit Double-D (DD) Rolled Drill. It combines the strength of the forged type drill with the accuracy and uniformity of the milled type.

The flute of the DD is formed straight from the bar stock by successive passes through specially built and patented rolls at a temperature of 1850° F. This mechanical rolling of the flutes produces a refinement and uniformity in the grain of the steel and gives additional density at the centre and at the outer edge. Each drill is rolled separately, and the rolls are so designed and operated as to produce the same uniform increase in web thickness as is obtained in high-grade drill of the milled type.

The fluted drill is reheated and twisted in a specially designed automatic machine. The twisting process is held absolutely uniform, giving the same increase in helix angle from shank to point, 27° to 32°: this standard has been adopted on our milled drills and has been proven by exhaustive experiments to be the most efficient.

The DD has increased production and cut drilling costs in many of the finest plants in Canada. A fair test will convince you.

Manufactured and carried in stock at Walkerville in all sizes from ½ inch to 1½ inches.

We also manufacture and carry in stock all sizes and types of high speed and carbon milled drills.

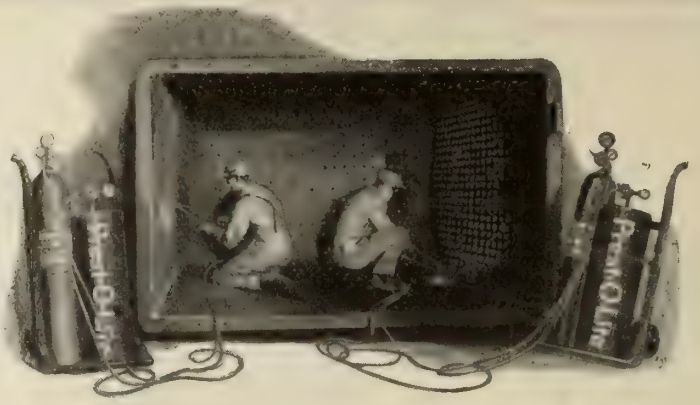
CANADIAN-DETROIT TWIST DRILL COMPANY, LIMITED

Walkerville, Ontario

STEEL MAKING

Our business is the manufacture of all commercial analyses in open hearth and electric furnace alloy steels:

Chrome-Vanadium Steels
Chrome-Molybdenum Steels
Chrome-Nickel Steels
Magnet Steels
Chrome-Carbon Steels
Chrome Steels
Nickel Steels
Hi-Carbon (electric furnace)
Special Analyses



Our rolled products are bars, billets and slabs in practically all of the sizes generally used. The bars we can furnish heat treated and cold drawn to specifications, and we are efficiently equipped for these operations.

Our organization, backed by years of actual experience in the making, application and treatment of Alloy Steels is at the service of our clients.

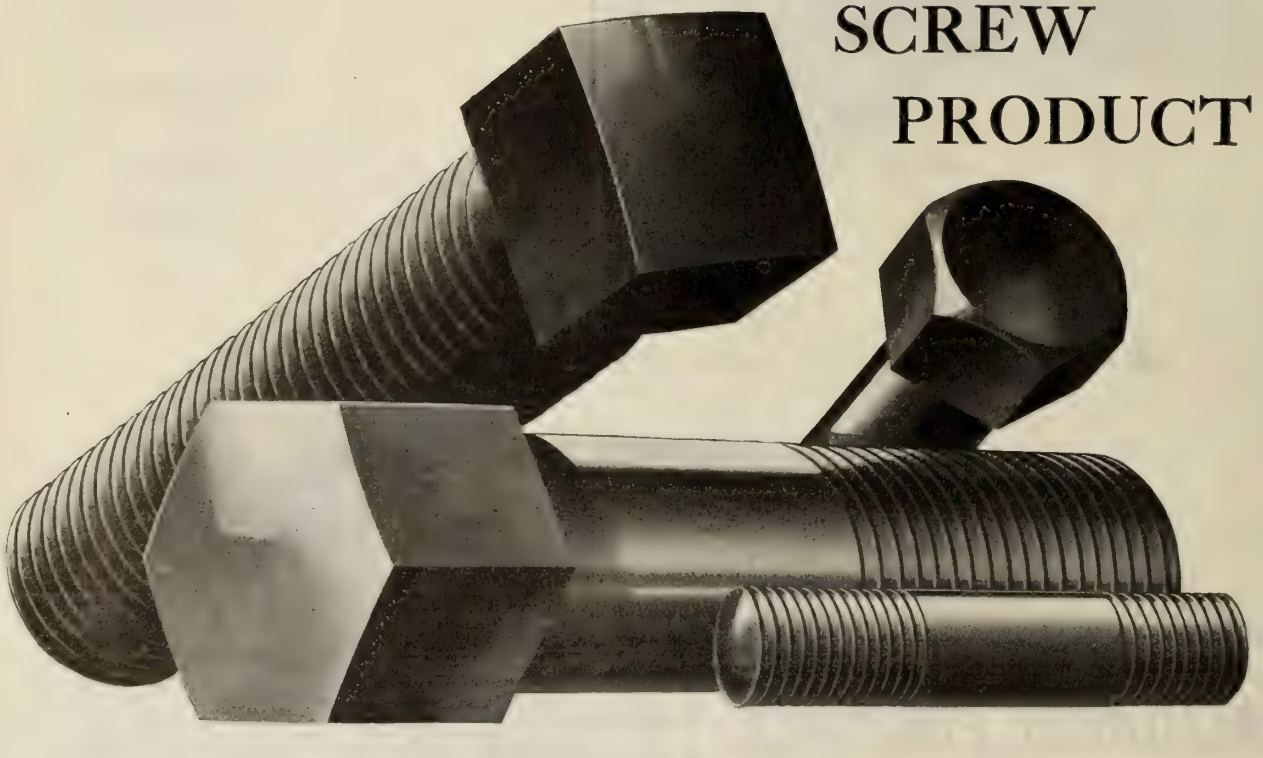
Locomotive Cylinder or Dome Facing Machine

This is our latest Locomotive Cylinder or Dome Facing Machine. It embodies many improvements and has been pronounced very satisfactory.

Gearing is all cut from the solid. When working, the clutch is thrown in by moving the lever with clutch pin attached (shown in illustration, on top near the hand crank) and the machine feeds automatically. All working parts are covered and easily oiled. Taper socket can be furnished to take the place of hand wheel for air motor drive.



When ordering, give the inside diameter of the work. Details upon request.

Usage Proves Their Economy

We answer the question—"**Which** Screw is the most economical?" by **proving** that our make is. Our Standard Machine Screws are really standard. This insures uniform fits. They are made in a modern plant by thoroughly competent workmen—no beginners. When you want your order on Tuesday you get it Tuesday—not Wednesday. And yet the prices we quote are no higher than you are obliged to pay for inferior work. If you require something better than is usually supplied say—"Torrington."

A PHOTOSTAT Would Have Prevented Such A Mistake

LAYING the blame on the drafting room doesn't help us. Theoretically they should have noticed those transposed figures when they checked the tracing, but the fact remains that the error crept in in spite of the checking.

"And what is the result? It will cost us our entire profit on the job to correct the results of that mistake. And we could have bought several PHOTOSTATS with what we will lose.

"That mistake **couldn't** have occurred if we had made PHOTOSTAT copies of the blueprint instead of tracing it. The PHOTOSTAT makes photographic facsimiles so you don't even have to check them.

"And compare the time it takes to make PHOTOSTAT copies against the time it took our drafting room to trace that blueprint and to make additional blueprints. Why, it's a matter of minutes against hours. By copying blueprints, pencil sketches, drawings and orders with the PHOTOSTAT we can get all our work into the shop days earlier than we do now.

"I tell you, no matter from what angle you look at it, everything is in favor of the PHOTOSTAT.

"The PHOTOSTAT copies directly on sensitized paper and the cost per print is not over 25 cents.

"And we have any quantity of other kinds of work for the PHOTOSTAT. It will relieve our stenographers of a lot of copying—do it in far less time and with absolute accuracy. We can copy catalog pages, work sheets, contracts, production charts, letters, specifications, legal documents, and advertising layouts. The machine will more than pay for itself inside of six months."

Our booklet, "A Good Word for the PHOTOSTAT", contains letters from users of the PHOTOSTAT all over the country and in many different industries, telling of large savings the machine has made for them. Send for it.

MODERN
Plain Grinding Machines

Main Drive

The shaft is ground, and mounted on anti-friction bearings; runs at constant speed. Power can be applied from a line shaft or direct from motor. All parts are balanced to eliminate vibration.

Wheel Drive

More powerful than other types of same racing. A 4 in. endless belt carries the full power from main shaft direct to wheel spindle, giving constant smooth drive.

Gear Case

All speeds and feeds are secured from one gear box, a separate unit, which may be readily removed for inspection or renewal of bearings. Gears are in mesh at all times, and are engaged with shaft by our patented positive ball drive clutch, which permits instant change. Gears of steel with hardened bushings run in grease.

Send Us

—Blueprints and specifications, and we'll tell you what a Modern will do on your job.

Motor Drive

A constant speed motor may be attached to the main drive shaft of the machine by belt, silent chain, or flexible coupling.

All Modern Plain Grinders are specially designed for most convenient connection to motor.

Table Drive

This is through worm and worm wheel insuring smooth, uniform travel. Four table feeds, 22 in. to 104 in. per minute are secured by lever on front of machine.

Wheel Side

Travel is on "V" and "Flat" ways, giving true, accurate movements and long life. A gib prevents raising of slide when heavy cuts are taken.

Bearings

Wheel spindle has bronze bearings with outside taper. Quick take-up for wear without dismounting is provided.

Main drive has anti-friction bearings.

Headstock has ball bearings.

Gear box has phosphor bronze bearings.

All provided with proper lubrication.

All shafts are ground.

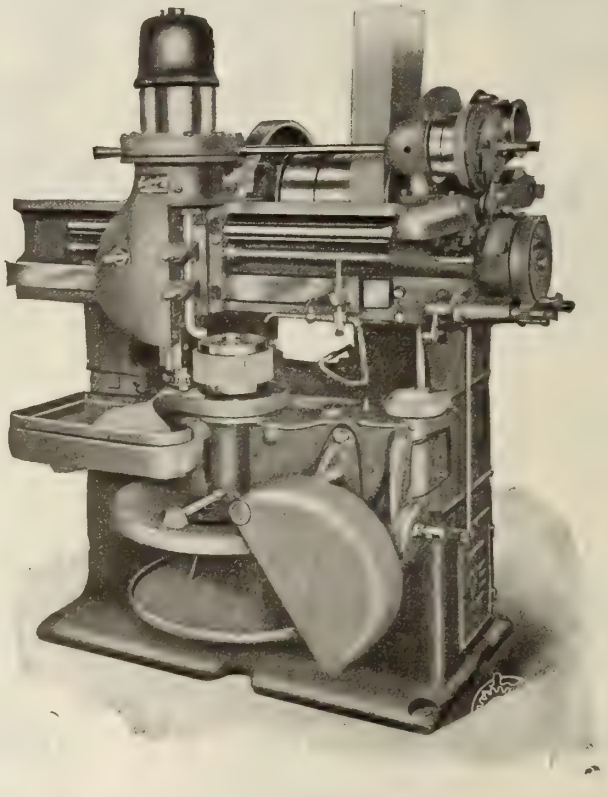
Gear Cutting With the "IFS" Left Out

The Gear Shaper Way



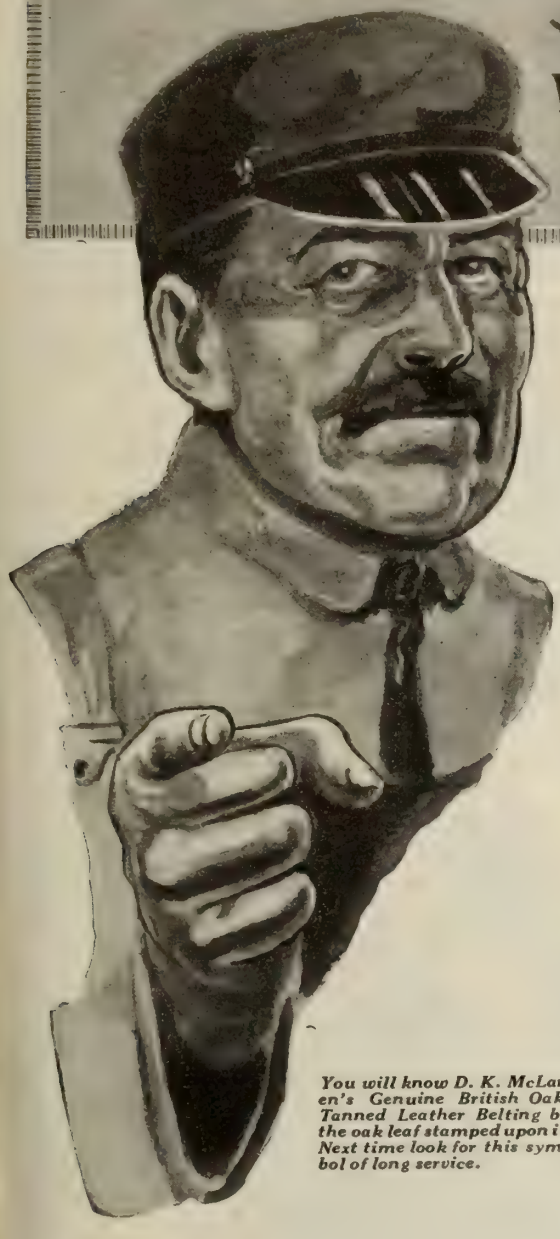
A production manufacturer knows that he will secure good gears IF he has an accurate cutter, an accurate machine and a machine working on the correct principle. The whole question of good gears is resolved in this little word "IF."

When the Gear Shaper was originally designed, the question of "IF" was taken into consideration and every possible means known to mechanical engineering was employed to eliminate the "IFS" from gear cutting.

That we have been successful in solving the problem is evidenced by the fact that each ensuing year sees a larger number of manufacturers adopting the Gear Shaper method.

How the Gear Shaper has accomplished this is clearly explained in our general catalog "Commercial Gear Cutting," which is a treatise on the subject of Gear Cutting with the "IFS" Left Out.

Send for your copy to-day



The Fellows Gear Shaper—the machine which has taken the "IFS" out of gear cutting

"Belting trouble ends where D.K.McLaren's Belting begins"

You will know D. K. McLaren's Genuine British Oak-Tanned Leather Belting by the oak leaf stamped upon it. Next time look for this symbol of long service.

And this fact has been proven over and over again!

Why, you ask, can D. K. McLaren's Leather Belting do for me what other beltings have failed to do? How can this belting eliminate slippage? How can it reduce stretch to practically a negative quantity? How can it prevent break-downs and power losses? What is the reason for such high efficiency in a belting?

Part of the answer is found in the fact that D. K. McLaren's Leather Belting is all leather—and the best leather at that. It is taken from the choicest steers and only the **backs** are used. That is why it is so strong, so flexible, so long-lasting.

The rest of the answer is found in the tanning process. **British-Oak-Tanned!** This preserves all the hide's natural strength and gives it added value.

A sure way to prove the economy of using D. K. McLaren's Leather Belting is to compare its hug, when slightly slack with the extraordinary tension required to make other belts grip. You will be satisfied that considering "value per dollar," D. K. McLaren's Belting is the cheapest on the market.

A list of the firms all over Canada using D. K. McLaren's Belting will be forwarded on request.

INCREASE THE CAPACITY OF YOUR MERCHANT

There are two kinds of business policies of the merchandising field to-day.

The first believes the goods are sold when they have been sold to the merchant. Having bought the goods it is up to him to sell them and to get rid of them the best way he can.

The other thinks of merchants in terms of their capacity to sell his goods to the ultimate consumer, and having sold them to keep them sold and keep them coming back for more. The former very often finds new competitors coming into the field, and taking away a great deal of the business he has come to expect should be his.
The second approaches his merchant on a man to man basis. He encourages him to build. He shows him clearly and carefully what he is doing to help him create a market for the products he is distributing. Through the business newspapers the merchant reads, he shows him the turnover possibilities in his line. In fact, he shows him how to make more money for himself, and incidentally make more for the wholesaler or manufacturer.

The second and most successful type of business realizes that training does not stop when he has trained and sold his own selling force on the goods he is merchandising. He realizes that this is only a beginning, that the great force of retail merchants who finally dispose of his goods to the ultimate consumer must be trained, must have knowledge, must have information, so they in turn can prove and sell the ultimate consumer.

The one great way to reach the merchants who are selling your goods is through the MacLean Trade newspapers, which merchants are reading every day and every week of the business year. They are reading them for new ideas, methods, for merchandising plans, for schemes to make more money. Now as never before they are studying the market pages and price quotations of every issue. Firms who are taking advantage of this avenue to better business are finding results far in advance of their expectations.

WILLIAMS' SUPERIOR

DROP FORGED HAMMERS

Are dependable tools because:—

Their heads, drop-forged from a special grade of tough steel, carefully hardened and tempered, neither crack, chip nor splinter.

They are fastened most securely and solidly to the handles—can't work loose—can't fly off.

Their handles are made of the best grade of clear, straight-grained hickory, flared at the grip to prevent hand-slip.

The weight and length of each tool are properly proportioned to give perfect balance, and, hence, increased striking power.

Williams' quality Hammers of all kinds and sizes. Catalog on request.

500% More Threads

MURCHEY

Solid Adjustable Taps

Murchey Solid Adjustable Taps, equipped with high speed chasers, will cut five times more threads than a solid carbon tool. Yet the chasers sell for about the same price.

The Logical Conclusion then is Murchey for Economy!

Besides this Murchey equipped machines can be operated at twice the speed of machines with carbon tool set-ups, and the chasers are always cutting full size. *These facts mean so much to you that*

You should write today for samples and the complete story.

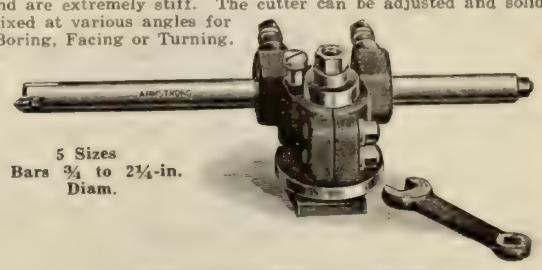
Armstrong 3-Bar Boring Tool

A slight turn of one nut releases or fastens both Bar and Holder.

Bars can be changed as needed almost instantly, thus allowing the operator to use the stiffest bar possible for each job, with the result that speeds and feeds can be increased and time saved.



No. of Tool	1-B	2-B	3-B	4-B
Diam. Bars.	½, ¾, 1⅛	9/16, 15/16, 1 5/16	¾, 1⅛, 1½	15/16, 1 5/16, 1 13/16
Length Bars	8, 11, 16	9, 13, 18	11, 16, 21	13, 18, 24
Size Cutters.	3/16, ¼, ⅜	3/16, 5/16, 7/16	¼, ⅜, ½	5/16, 7/16, ⅝
For Lathes.	14 to 16	16 to 18	20 to 22	24 to 32

Adjustable Boring Tool

Patented

This tool combines Convenience, Adjustability and Rigidity to a remarkable degree and is well adapted to a very wide range of work. The holder is easily adjustable to different heights and will hold bars of various diameters. The Bars are made from high carbon steel seamless tubing of heavy gauge and are extremely stiff. The cutter can be adjusted and solidly fixed at various angles for Boring, Facing or Turning.

5 Sizes
Bars ¾ to 2¼-in. Diam.

AN IMPORTANT QUESTION

For the Advertiser to Answer

Is the Publication Soliciting Your Business a Member of the Canadian National Newspapers and Periodicals Association?

YOU would never engage a man on an important piece of work until you gained a thorough knowledge of his qualifications. It would not be wise. You first of all require a clear record of his character and ability, in addition to a statement of his aims and aspirations. When you are in possession of this information you have a real basis for judging his fitness to serve you.

It is just as important that you should know the character, ability and aspirations of the publication in which you desire to carry your business message.

You should know if the paper is circulating and has an influence among those men who are responsible for results—the men who buy, or influence the buying, of machinery, tools, power and any other equipment or merchandise which you may sell.

Facts are essential. When you are in possession of the facts you can make every dollar spent for advertising a judicious investment. To enable the advertiser to make such judicious investment is the purpose of Canadian National Newspapers and Periodicals Association. From this Association the advertiser may secure complete information concerning the character and aims of the leading Canadian publications. The facts are fully presented for your consideration—and they are presented RIGHT.

CANADIAN MACHINERY

Buried in the Work and Broke!

Next time a tap breaks below the surface of a large casting, don't let some makeshift method of removing it injure the thread and waste half an hour of valuable production time. Instead—

Walton it Out in a Jiffy

And save the casting.

Special analysis steel fingers of the Walton Extractor drop into the flutes of the broken tap—and grip. Then a few turns of a wrench applied to the squared end of the Extractor backs out the buried tap.

Sixty-day trial offer proves the Walton Extractor pays for itself.

Write.

The Walton Co.
Hartford, Conn.

The **Rockford Economy**

Small But Powerful

Every tool room needs the Rockford "Economy" Back Geared Engine Lathe. It possesses all the speed, accuracy and power of a large lathe yet is small and convenient. Made in 12", 14", 18" and 22" swing. You owe it to yourself to get full particulars.

Rockford Lathe and Drill Co.
Rockford, Illinois, U.S.A.

When labor is expensive, there is all the more reason to use efficient tools.

Much time and effort can be wastefully expended on a filing job.

If, at each stroke, a file does not cut keenly, discard it and buy a new one.

Watch for the least loss of efficiency.

And insure maximum cutting-service by specifying one of these brands:

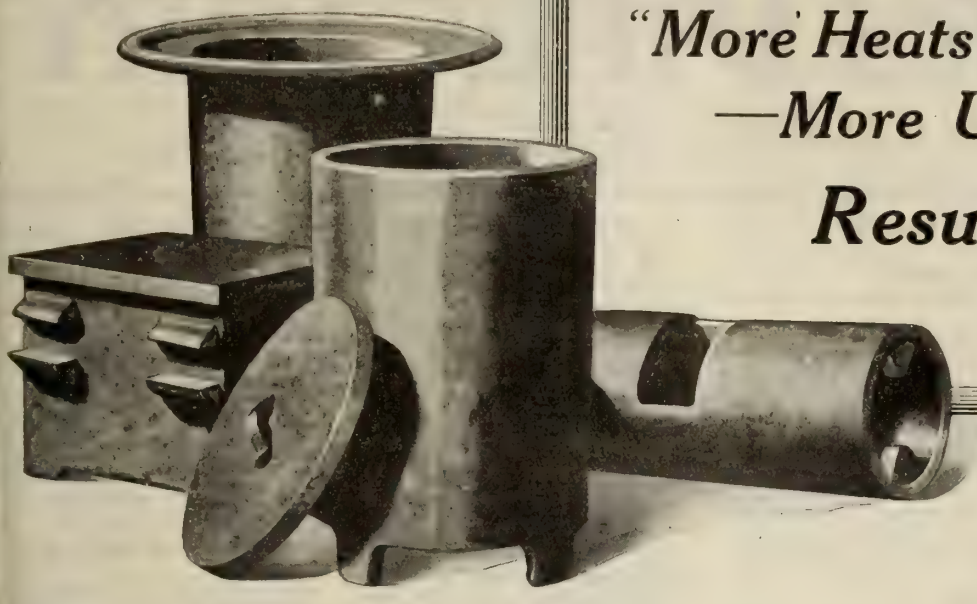
Valvular Tank Trouble

WHEN oxygen tank valves leak—in transit or in operation—dollars are dissipated in the air instead of being pocketed by efficient welding or cutting work at the blowpipe tip.

Dominion Oxygen cylinders—like the product—are perfected in every detail. The Wedge Valve on a Dominion Oxygen tank cannot leak. It is the evolution of years of painstaking study, both in design and structural material.

Forged from bar stock, it resists the wear and tear of internal friction and if foreign matter, by any chance, score the face the valve re-seats itself while the tank is fully charged and in operation — a unique time and money-saving feature. And a twist of the fingers is all that is necessary. No tools are required.

This insurance against interruptions and failures has commended itself to all users of Dominion Oxygen. It also means that Dominion Oxygen reaches the consumer free from impurities and with cylinders filled to capacity—there can be no leakage en route or in application.



And with six centrally located distributing stations in full operation, the Dominion Oxygen Company, Limited, is prepared to supply consumers with any quantity of uniformly pure oxygen anywhere. Our policy of filling all orders on the day of receipt means the quickest and most satisfying oxygen service in the Dominion.

"More Heats per Dollar —More Uniform Results"

That's How a *USER* Expresses Himself

"More Heats per Dollar—More Uniform Results" carries a world of meaning to the heat treating man in search of the ultimate. Simply add the subject and you have the answer you've probably been looking for in your own carbonizing work.

That subject is Cast Nichrome Containers and the "More Heats per Dollar—More Uniform Results" is simply a Nichrome user's "compact" way of stating the reasons why hundreds of other companies are using Cast Nichrome Containers.

If you haven't FULL information as to WHY Cast Nichrome gives such long uniform service and contributes so much to high grade results, we'll be glad to give it to you. Somewhere Cast Nichrome Containers are being used under conditions similar to yours. Shall we show you?

DIRECTORY OF DEALERS

THE Buyers' Directory of CANADIAN MACHINERY was originally intended to contain information regarding lines actually manufactured by our advertisers. We now carry the advertising of leading machinery dealers, some of whom represent scores of manufacturers in addition to being manufacturers themselves in some cases. This necessarily widened the scope of our Directory, but it would be impracticable to list all the lines handled by all the dealers. We recommend, therefore, if our subscribers cannot find what they want in our Directory that they communicate with the dealers whose names appear herewith.

INTERNATIONAL MALLEABLE IRON CO., LIMITED
GUELPH, ONTARIO, CANADA

Malleable and Cast Iron PIPE FITTINGS

Made in Canada and Exported Abroad

A LARGE plant, up-to-date facilities and thoroughly experienced staff place us in a position to offer unequalled quality, price and quick delivery on Malleable and Cast Iron Pipe Fittings; both screwed or flanged, black or galvanized. All sizes from 1/8 inch up.

We make a specialty of exporting our products and can furnish designs required in any country, such as the Whitworth or "V" thread in use in England, the Metric Pitch in France, or the W. S. Standard in use in Canada and the United States.

We will be glad to answer your enquiries

International Malleable Iron Co.
Limited
GUELPH, ONTARIO, CANADA

Gridley Singles

More of YOUR WORK should be done
AUTOMATICALLY

The wide range of work possible on Gridley Automatic Turret Lathes and their ease of set-up have made them economical producers of duplicate parts up to 4¼" on both short and long runs.

Fast feeds in heavy forming, drilling or turning give all you can reasonably expect in output.

Tell us what you want and we will tell you how many per hour —accuracy guaranteed.

JBBSCo

You can't help noticing the good qualities of

Pratt & Whitney Taps

Their free cutting qualities, their extreme accuracy and their extraordinary ability to outlive others distinguish them.
The con-eccentric relief—a distinctive P & W feature—is the secret of their goodness. One-third of the cutting edge is concentric. The remaining two-thirds has eccentric relief. Taps can be sharpened at the only correct point—on the face of the cutting edge. Sharpening in no way affects their size.

Yes, they cost a little more than some others, but they're well worth the difference. Carried in stock as are all other P & W Small Tools at our sales offices and agencies as listed.

Reduce Fire Hazard in Handling Oils

The fact that in 35 years Bowser Equipment has never started or contributed to a fire or explosion is your guarantee that Bowser will serve you *safely.*

Scientific design and expert workmanship are the reasons for this enviable safety record. Fire has often swept over and around Bowser Equipment, but its all-metal leak proof construction has protected its contents. This same feature eliminates leakage and gumming, making Bowser **Equipment** economical as well as safe. The Piston-Type Measuring Pump, equipped with positive mechanical stops, assures accurate measurement of any desired quantity.

Install a battery of Bowser Pumps and Tanks and centralize your oil storage, safely and economically.

THE JOHNSON FRICTION CLUTCH

It's a Johnson Lineshaft Drive

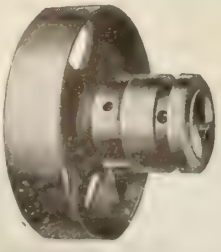
A battery of twelve light presses, all on a bench about 30 x 5, driven from one lineshaft with Johnson Clutches controlling the machines.

Illustration by courtesy of The New Departure Manufacturing Co., showing bench presses in operation at their Elmwood Plant.

COMPARE IT FOR FIRST COST

Twelve Clutches against twelve complete counter shafts, or twelve individual motors.

COMPARE IT FOR EFFICIENCY.



Quick, smooth control against the sluggish tight and loose pulley. Or one motor consuming current instead of twelve.

COMPARE IT FOR SERVICE.

You know the failing of belts—the continual attention they require, especially when they are shifted. If you don't know Johnson Clutch Service, just give it a trial.

Write for our booklet

"Clutches As Applied to Machine Building" and our Yellow Catalog.

FRICTION CONTROL MEANS BETTER MACHINERY

We specialize in applying the proper type of friction clutch on any sort of an installation. Standard clutches available from stock, and special models developed to suit conditions.

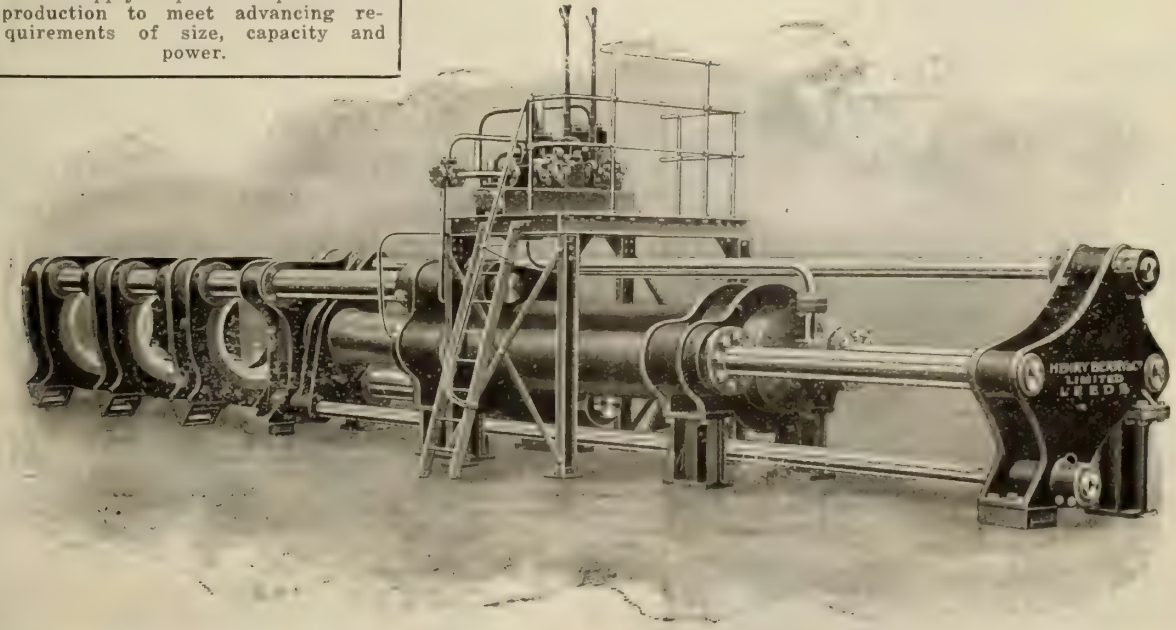
***Head Office*—Montreal**



A Cradle Of Imperial Industry

Concerned for many years with the design and the manufacture of some of the largest types of machinery for the British Government, the Colonies and the Indian Empire, the firm of Henry Berry & Co. possesses some of the most extensive resources in the country for the production of the biggest, most powerful and most practical types of hydraulic machinery for Shipyards and Industrial Enterprises. These include all kinds of Shipyard Tools, Plate and Armour Bending Rolls, Rivetters, and Punching and Shearing Machines, Presses and Cranes.

Designs and estimates will be submitted to all requirements without charge. Prompt deliveries with full guarantee of Quality and Power.

750 TON PUNCHING & DRAWING PRESS

Pioneer manufacturers of hydraulic shell forging presses for the largest shells in use during the Great War, we are likewise always to the fore in the supply of plant for peace time production to meet advancing requirements of size, capacity and power.

STEEL *for*

Every Commercial Purpose

We are the only company in Canada producing steel ingots by the "HARMET" Liquid Process, a process that makes these ingots vastly superior to the ordinary kind, improving the physical properties and reducing the waste of ingot.

We can supply forgings of all shapes and sizes made of ordinary or "HARMET" Fluid Compressed Open - Hearth Steel on the Shortest Notice.

BRISTO
REG. U. S. PAT. OFFICE
PATENTED SAFETY SET SCREWS

SET A NEW STANDARD

The distinctive dove-tail slots or flutes of the "Bristo" safety set screw are one of the features which put "Bristo" in a class by itself. "Mushrooming," for instance, is impossible, and splitting or cracking have been removed from the list of your manufacturing worries. As the wrench turns, the unique "Bristo" design contracts the screw; on releasing the pressure the screw tends to expand—a tremendous gripping factor.

Do You Read These Advertisements?

Every advertisement in this magazine is worth reading. It is the product of some concern that is using a modern method of making sales, viz., technical paper advertising, in order to present most effectively to you the leading features of its line.

These advertisers are making it easier for you to buy intelligently with the least waste of your time and theirs. They realize that a sales force can not replace this service at equal cost. They know that advertising is good business, for the manufacturer who does not advertise cannot save the cost of advertising. Consistent advertisers are progressive merchandisers. They are saving your money and their own; and it pays to do business with them.

Don't miss your opportunities. These advertisements are interesting. Many are distinctly instructive, and a glance through them every month will keep you posted on the latest developments for machinery equipment.

No Vertical Adjustments

Cylinder Grinding has grown to such proportions that it occupies a very prominent place in the grinding field. The most accurate equipment must be used and a quick set-up obtained in order to produce the highest quality of work in record time.

The Landis No. 5 Cylinder Grinding Machine is built to handle all makes and types of motor blocks cast singly or *en bloc*. The cylinder holes are properly located with the center of wheel rotation by the centering device. This is only one of the many exclusive features in a *Landis Cylinder Grinder.*

May we describe to you some of the other interesting features?

For Self-Promotion And Sales Promotion

Are you interested in any of these fields—power—metal working—marine? As a manufacturer, or purchasing agent, as a superintendent or foreman, as an ambitious mechanic or engineer?

Use These Publications

They will keep you strictly up-to-date in all branches of mechanical engineering. Edited by practical men. Cheerful, inviting, instructive, authoritative.

POWER HOUSE

Twice a month—$2.00 per year.
Serves the power plant engineer—Steam, Electric, Refrigeration, Hydraulic.

CANADIAN MACHINERY

Weekly—$4.00 per year.
Covers the metal working field—serving shop executives, purchasing agents and owners. First-class mechanical paper and market paper combined.

CANADIAN FOUNDRYMAN

Monthly—$2.00 per year.
A paper for the foundry owner, superintendent and foreman. Claimed by its readers to be unexcelled.

MARINE ENGINEERING

Monthly—$2.00 per year.
Interprets marine engineering in its broadest sense, serving the shipbuilders, navigation companies and their officers. (The editor holds an extra first-class B.O.T. certificate.)

AN IMPORTANT QUESTION

For the Advertiser to Answer

Is the Publication Soliciting Your Business a Member of the Canadian National Newspapers and Periodicals Association?

YOU would never engage a man on an important piece of work until you gained a thorough knowledge of his qualifications. It would not be wise. You first of all require a clear record of his character and ability, in addition to a statement of his aims and aspirations. When you are in possession of this information you have a real basis for judging his fitness to serve you.

It is just as important that you should know the character, ability and aspirations of the publication in which you desire to carry your business message.

You should know if the paper is circulating and has an influence among those men who are responsible for results—the men who buy, or influence the buying, of machinery, tools, power and any other equipment or merchandise which you may sell.

Facts are essential. When you are in possession of the facts you can make every dollar spent for advertising a judicious investment. To enable the advertiser to make such judicious investment is the purpose of Canadian National Newspapers and Periodicals Association. From this Association the advertiser may secure complete information concerning the character and aims of the leading Canadian publications. The facts are fully presented for your consideration—and they are presented RIGHT.

Typical Applications of Ball and Roller Bearings

Discussion of Earlier Types — Interesting Experiments Which Have Been Made — Points of Importance — Load Carrying Capacity—Question of Wear—Lubrication is Important Factor —Sectional Views of Applications

*By O. H. WILLISON

SEVERAL articles have recently been written dealing with the history of ball and roller bearings, and it is therefore unnecessary to go over this ground again. The object of this article, however, is to describe what is necessary in a good bearing, to deal with some typical applications, and to discuss some of the causes of failure. It is generally conceded that the old cup-and-cone type of ball bearing is useless where heavy loads have to be carried. They will work satisfactorily at light loads and medium speeds, and, much as we may smile at them now, we should remember that they served their purpose and led the way to present day practice.

In the early four and three-point bearings, radiused tracks were not employed, and some of the first two-point bearings were provided with flat tracks. Investigators soon discovered, however, that the load carrying capacity of a ball race of given dimensions and containing a given number of balls could be increased 200 or even 300 per cent by suitably grooving the ball paths. In order to make the point of contact under load as large as possible, the curvature of the

*Author is Bearings Engineer with the Lyman Tube & Supply Co., Montreal.

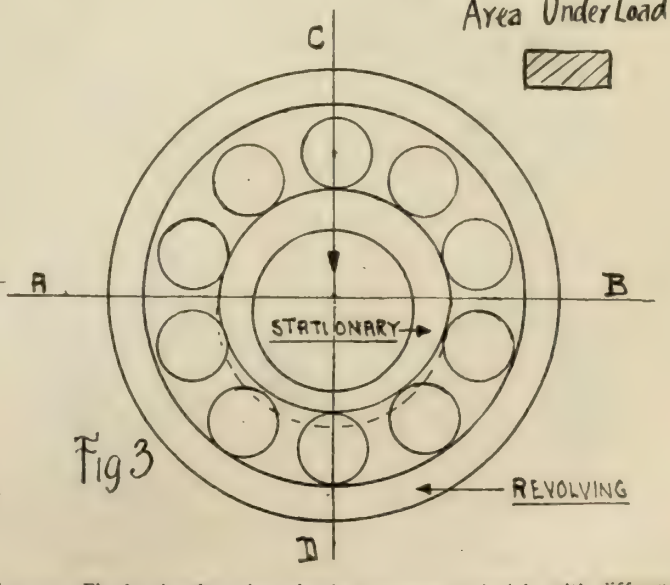

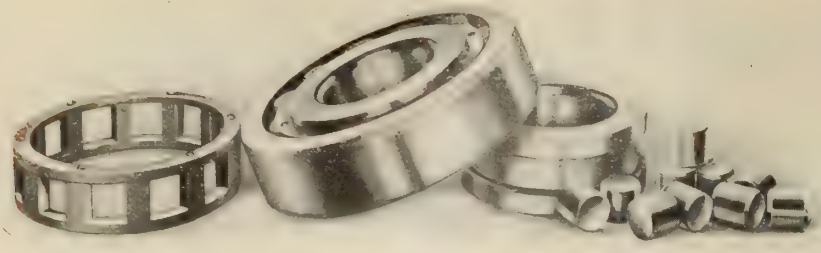

Fig 3

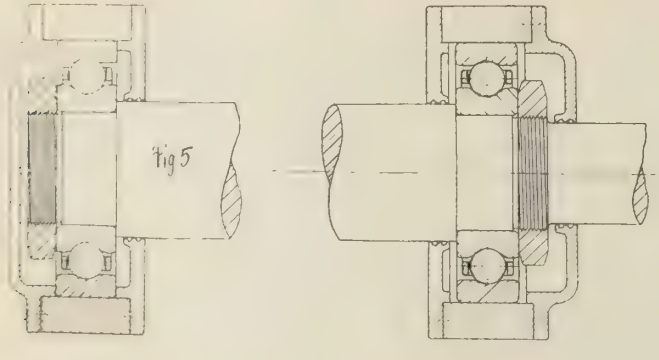
Fig. 1.—Cross section of race ring. Fig. 2.—Illustrating the question of wear. Fig 3.—Another view showing the same principle with different conditions. Fig. 4.—Ball and roller bearings compared in sketch form.

Typical roller bearing showing it both in assembly and detail.

race should be as near that of the ball as is commercially feasible to ensure a clearance.

To illustrate the advantage of the grooved track over that of the flat, some interesting experiments were conducted in the testing laboratory of The Hoffman manufacturing company, Chelmsford, England, at which the writer was present. Balls 1-1/8" in diameter were subjected to a pressure of 10,000 lbs. on flat and grooved surfaces respectively. The exposed surfaces were etched, and, after removing the load and the balls, the unetched area, i.e., that actually in contact with the ball under loading, was carefully measured. The pressure per unit of area was computed and found to be:—



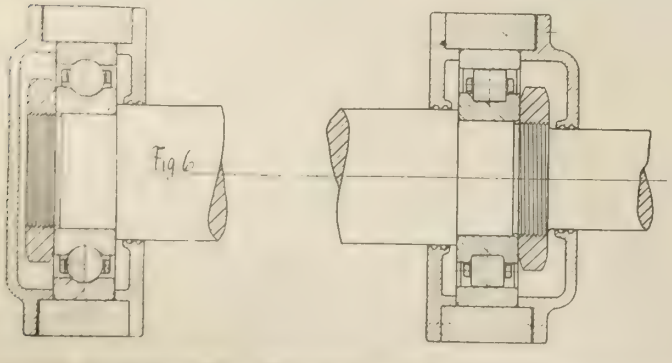
Flat Surface—708,461 lbs. per square inch.

Grooved Surface—324,550 lbs. per square inch.

The grooved and curved surfaces in each instance were actual races upon which the ball would run in a bearing, and the results clearly indicate the reason for the increased capacity of the grooved ball track as against that of the flat type. It is obvious also that any radical departure from this grooved type of bearing would result in decreased carrying capacity of the bearing, because, the higher the pressure per unit of area, the less will be the ability to carry load.

The load carrying capacity of a ball bearing is influenced largely by its design and manufacture. The outside dimensions of all single row bearings are standardized and cannot be altered, so that the principal dimensions that can affect this load carrying capacity, other things being equal, are the number and size of the balls. It will be found, however, that other things are not equal, and that each manufacturer has a different proportion for the internal dimensions of the bearing.

The size of the ball should be as large as possible, but is limited by the thickness at the bottom of the track: The cross section of the race rings (Fig. 1) should be thick enough to prevent distortion of the race by a housing, which is not quite true, or busting of the inner race when forced on a shaft. Strength against distortion is a very important consideration. The rings should be made sufficiently heavy to ensure their being properly hardened without fear of cracking. Some makers cut this thickness down to one-quarter the diameter of the ball, while others work



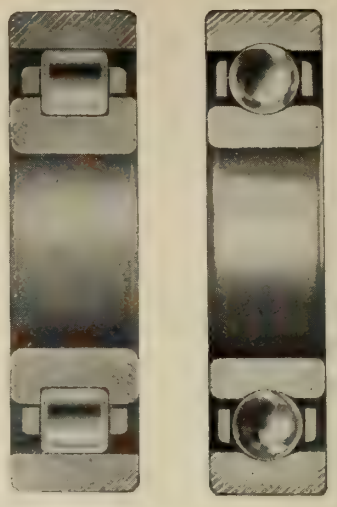


Fig. 5.—A simple form of mounting. Fig. 6.—A case where ball and roller bearings are both used.

Sectional View of Ball and Roller Bearings.

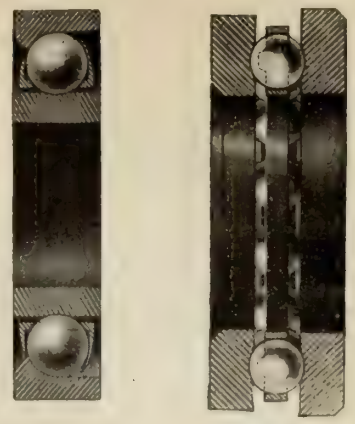
up to one-half the diameter. It is evident that it is not fair to base a load table on the diameter of the balls, if this has been obtained by reducing the thickness of the race to such an extent as to weaken it, and thus reduce the load carrying capacity of the bearing as a whole.

Points of Importance

Next in importance to the size of the balls is the number of them. The diameter of the pitch circle being settled the amount of space for the balls is fixed by the thickness considered necessary for the cage "Y". This thickness should not be cut down too fine, as experience has proved the desirability of a strong rigid cage. In the case of bearings that are running with a steady load, the pressure required to keep the balls in their place is practically nil, but, where the load varies, or they are subjected to jars and shocks, a stout and strong cage is necessary to prevent the balls from bunching, and, from the way some cages are torn to pieces, it is evident that the strain which can come upon a cage is considerable. Some makers cut the thickness of the cage between the balls down to one-tenth the diameter of the ball, while others work up to one-third the ball diameter. Here again it is not reasonable to calculate a load table on the number of balls used, when weakness of the cage cuts down the load carrying capacity of the bearing as a whole. To obtain the best results, the ball cage should be tough and uniform yellow metal. An iron cage tends to lap down the balls.

Next to the number and size of the balls the curvature of the ball race "Z" is important. In order to make the point of contact under load as large as possible, the curvature of the race should be as near that of the ball as is commercially possible to ensure a clearance. Different manufacturers have their own standards, and these vary from about two per cent to twenty per cent larger than the ball. The sides of the track "A", both of the inner and of the outer race should be carried up as high as possible, although this can be carried too far and the load carrying

capacity of the bearing weakened in consequence.



The strongest race is undoubtedly what is called "the unbroken ring or nogap type"; that is, where there is no transverse slot for introducing the balls, and the sides of the race are carried up as high as possible. This adds to the depth of the cross section and increases the power of the races to resist distortion. Unfortunately, however, this design limits the number of balls to those that can be put in by placing the races eccentrically. More balls can be inserted by use of a transverse filling slot, but this weakens the race and the balls are liable to be damaged if great care is not taken when they are inserted. The greater number of balls that can be used by this method, if carefully carried out, should, however, more than compensate for the somewhat weaker race.

The material of which the balls and races are made should be of the very hardest, consistent with absolute uniformity and freedom from cracks; a suitable mild steel, (and this should not be confused with what is usually known as ordinary machinery steel) properly carburized, is the most suitable for the races, for the reason that the ball tracks can be made harder than any other method. It requires such careful attention and such skilful handling in manufacturing, however, that comparatively few ball bearing manufacturers have adopted this method. The great difficulty with chrome-carbon steel bearings is that of obtaining a uniform hard race.

Load Carrying Capacity

It will be seen from the foregoing, then, that the load carrying capacity of a ball bearing depends not only on the size of the balls used nor on their number, not alone on the depth of groove or on the fact that the raceway is of the nogap or unbroken ring type; not alone on the quality of the steel in the raceway or in the method of hardening, but, on the scientific balancing of all these points by a manufacturer who has had years of experience, and a system of inspection which renders it impossible for a defect to go unnoticed.

There is one other point in connection with the load carrying capacity of ball and roller bearings that has not received its proper attention from manufacturers, and that is the nature of the

Sectional View of ball journal bearing and single thrust bearing.

applied load. The capacity of the bearing cannot be determined, as we have said above, by the number or size of the balls; nor, can it be determined by the weight necessary to crush the ball or rollers, but by the elastic limit of the steel. As soon as this limit is exceeded, the surface begins to peel or brittle away, and it will be obvious that this point can be brought about by many conditions of loading, also, that it is not so much the amount of load which a bearing is called upon to carry which affects its behavior, as the conditions under which it is dealing with the load.

For instance, when the duty consists of supporting a dead mass with the bearings mounted in a substantial housing on a rigid base plate bolted to a solid cement foundation, the effect on the bearing is more severe than when the load is imposed by gearing or some spring method. In the first place, all shocks must be absorbed in the bearings themselves, while, in the second case, this is dissipated to some extent by the "give" in the various parts of the mechanism.

A somewhat remarkable example of this, recently came to the attention of the writer: A motor was to be mounted on ball bearings, loads, etc., were calculated, and the proper bearing applied. Shortly after this, an enquiry was received from a concern who wished to install a thrust bearing on the propeller of an aeroplane. The calculated thrust would have meant a bearing of large dimensions, whereas, in actual practice, a very much smaller bearing was entirely satisfactory; due, simply, to the fact that in the case of an aeroplane the shocks and stresses are dissipated through the various parts of the machine, whereas, in the motor the bearings were called upon to take all the shocks and loads, and these could not be passed along in the form of "give."

This goes to prove that load tables, as published, are not of much use, except as a guide to give us the relative load carrying capacity of one size bearing compared with another. It is obvious that if a bearing is selected by reference to a load table without taking into account the nature of the work it has to do, the results will not be satisfactory. Unfortunately, many designers of machinery still adhere to this practice, although most users have formed their own coefficient for the various makes of bearings. Here it may be well to point out the impossibility of making any adjustment for wear in radial bearings by means of lateral displacement of the races.

The Question of Wear

Referring to Fig. 2. The shaft and inner race revolve in a stationary race and housing. Any wear that takes place will be equal around the revolving race but will only occur in the stationary outer race when the load comes, namely, the bottom. This outer ball race, therefore, will be larger across the vertical diameter C-D where the wear has taken place, than across its horizontal A-B where there has been no wear. Fig. 3 illustrates the same principle, except that the outer race is the revolving member, consequently, the inner or stationary race wears down. This applies with equal force to any type of roller bearing. Several designs of roller bearings have been placed on the market at various times. To ensure satisfactory results, the rollers should be of steel in solid form, perfectly parallel, and they should run between hardened and ground surfaces. The action of rollers, if on cast iron, grinds it into powder, whereas, if they run on soft steel, the surface flows under the rolling action and eventually peels. Long rollers have the disadvantage in that it is difficult to keep their axis parallel with that of the shaft. It is obvious that the slightest variation in diameter will cause one end of the roller to travel in advance of the other, with resultant skidding and wear in the bearing, and, even should they be perfectly parallel throughout their length, it is impossible to ensure the load being uniform, which gives the same result. To my mind hollow rollers are unable to withstand shock loads to the extent of the solid ones, while those of the helical spring type or the rolled tubular form are prone to hardening difficulties and certain failure where heavy loads are concerned. Taper rollers limit the scope of the bearing to shafts using two journals while great care must be exercised in their adjustment at the outset. Experience has proven that the best results can be obtained from a roller bearing in which the length of the roller is

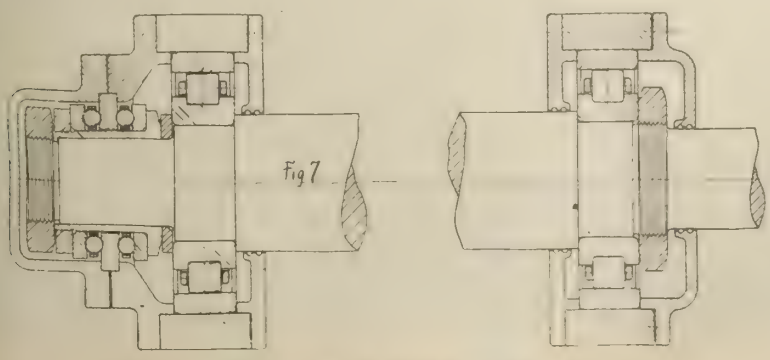


Fig. 7.—Heavily loaded shaft with a definite end thrust.

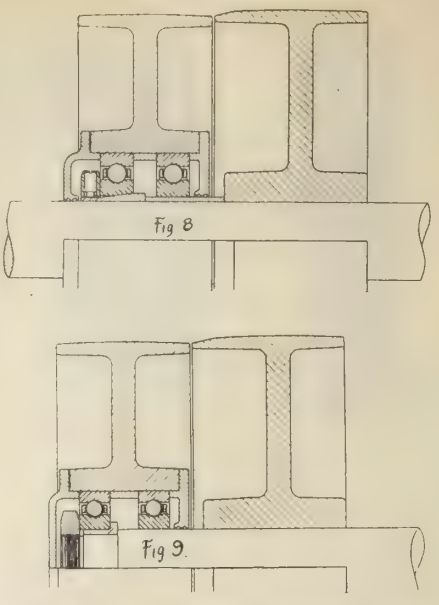
equal to its diameter. The rollers run in a groove formed in the inner ring, the flanges on which correct the rollers should there be any tendency to skew.



A bearing of this type was used, amongst others, by Prof. Goodman in obtaining data for his paper entitled, "Roller and Ball Bearings", which was read before the Institution of Civil Engineers, London, in February, 1912. In the paper the author says: "It gave excellent results on test". Many roller bearings have a tendency to generate end thrust, and this formed one of the main points in the paper referred to. However, the author states that "it gave excellent results as regards friction and end thrust."

This end thrust may be attributed to one of two things—either the rollers are not made truly cylindrical, or, the load is applied in such a manner as to impose a tilt on the roller and thus a tendency to climb endways. This first difficulty has been overcome by the development of special automatic grinding machines, from which it is possible to obtain rollers in large quantities perfectly cylindrical; in fact, the precision is so fine that the rollers produced by them in the ordinary commercial way are issued under a National Physical Laboratory certificate, and are being used in many shops in England as shop gauges.

Bearings of this type have a carrying capacity fifty per cent greater than ball bearings of the same size, and, as they are made in the same "International" sizes, their advantages are obvious. They are not intended to supersede ball bearings, but have been designed to take care of heavy loads under conditions where space is limited and where a ball bearing of required capacity would be of such a large diameter as to make its use impracticable. The fact that roller bearings do not produce end thrust has been proven in actual practice by the long periods they have been running under heavy loads. Several applications are shown and are well worth careful study.

Moreover, it has been found under actual working conditions that the short roller bearing is just as efficient as a ball bearing, and a glance at Fig. 4 (which is greatly exaggerated) will illustrate this point. The point contact of a ball develops to an area when the ball is under load and distortion takes place. The line contact of the roller develops also when the load is applied. Areas have been measured by the method previously referred to and it has been found that there is no difference between them. Tests taken have shown that the co-efficient of friction is as low with this type of bearing when loaded to its rated capacity, and in many cases lower than the corresponding size of ball bearing.

The question of "creep" in a bearing is not very well understood, and it is evident that some ball bearing manufacturers themselves have not as yet solved the problem. The writer hopes to deal with this question very fully at a later date, and to correct from experience gained one or two wrong impressions concerning it.

Figs. 8 and 9.—Showing application of ball bearings to loose pulley.

Question of Lubrication

It is impossible to give too much attention to the question of lubrication, and experience has proven that in the majority of cases grease is the most suitable. All anti-friction bearing manufacturers have developed bearings having highly polished surfaces, and they have a right to insist that when in use they be given not only sufficient lubrication, but that a lubricant be used which will not in any way impair their chances of success.

Until recently this was not given very much attention, with the result that bearings failed, not through faulty design, defective material or installation, but owing to an inferior grease having been used. To-day, however, manufacturers of lubricants have an intelligent knowledge of what is required. It is not necessary to describe in detail the component parts of a good ball bearing grease. Suffice to say that it should be pure mineral product free from acid and alkali, and about the consistency of vaseline. If users will remember this and obtain their supply from an accredited source, no trouble should be experienced.

Equally important with the proper lubrication of a ball bearing or roller bearing is the necessity of protecting the moisture entering the housing. This has been one of the bearing manufacturers' greatest problems, and it has taken years of patient propaganda on their part to get users to take the necessary steps to attain this end. The ordinary installation presents no difficulty, but where particles of dust or emery are in proximity to the housing, great care should be taken. The difficulty has been overcome largely by using flingers, which throw off all foreign matter, or by the use of labyrinth packing, past which it is almost impossible for any foreign matter to get.

Protection from water has been achieved in much the same manner, although the best way to keep water out of a housing is to keep it well packed with grease. No difficulty need be experienced if users will follow the advice given by makers of bearings.

Fig. 5 illustrates the simplest form of mounting a revolving shaft on two ball journal bearings, and it is well adapted for applications where the load is not heavy. One bearing only is held for end thrust, and this should always be the one most lightly loaded. The inner race of each bearing must be a tight press fit on the shaft, and held securely against a shoulder by means of a lock nut. Care should be taken in machining the shaft that the lock nut automatically tightens itself against the direction of rotation Two or three shallow cut grooves in the bore of the end cover make an effective seal against dirt, although, if the bearing is exposed to particularly dusty conditions, a felt washer should be held against the end cover by means of a collar. Generally, though, this is not necessary.

Fig. 6 illustrates a horizontal revolving shaft where one end only is heavily loaded, and where there is not sufficient room for a larger ball bearing. In this case, a roller bearing as described above is installed. The inner race of this bearing must be a tight press fit on the shaft and held securely by a lock nut, care being taken that the face of the nut does not bear against the bearing to a greater diameter than the bottom of the roller track. If necessary, the face of the nut should be relieved to an extent necessary to insure this. The outer race should be a tight fit in the housing, not a driving fit, and must be held firmly endways, care being taken that the spigots on the end covers are adjusted to insure that the rollers track centrally. The end thrust is taken by the ball bearing at the other end of the shaft.

Even where the end of the shaft is completely enclosed, it is desirable to use end covers, owing to the difficulty of machining a blind hole parallel throughout its full length.

Fig. 7 illustrates a heavily loaded horizontal shaft with a definite end thrust. The journal load is supported by two bearings of the roller type, and the end thrust is taken on a double thrust bearing. The inner races of the journal bearings are a tight fit on the shaft, and held securely against the shoulders. The outer races are also held securely endways, any lateral movement in the shaft due to expansion being taken care of in that the outer race is parallel throughout the entire width; the inner race and rollers can therefore automatically track in their correct position. The double thrust bearing is a single unit built up on a sleeve and correctly adjusted ready for use. The sleeve should be a push fit on the shaft and clamped firmly against distance piece by a nut securely locked in position. It is important that the recesses provided in the end covers for the central race of

Cutting Helical Gears on Automatic Machine

Various Operations on Automatics, Including Making of Stud—Dust Cap—Cutting Helical Gears—Chart Showing Tools Used —Machine Equipped with Rear End Threading Attachment

By H. A. WILSON

AS THE design of modern machine tools has been advancing along varied lines for many years, the automatic and semi-automatic lathe has been receiving more and more attention. Perhaps no one particular branch of the automatic lathe has more interesting features than the automatic screw machine. Probably because the product of these machines, when considered individually, is of modest value, many unconsciously take it for granted that the machine that produces such a humble little thing as a screw or a stud, is of humble value also. That is bad logic. The fact that these very same screws are of modest value is actually because the machines that enter into their production are among the greatest achievements in the vast field of machine tool development and design.

The consuming public to-day calls for these products in quantities termed by millions and at the same time is only willing to pay an insignificant sum for such articles. Furthermore the demand for accuracy is a very definite factor to be reckoned with in this particular production. Whether it is for the reasons suggested or for others more remote, the fact remains that few men, other than those whose daily duties keep them in close touch with these machines, seem to appreciate the quality and quantity of work done on them, or their extremely ingenious design. Thus they have to literally battle their way for a living, as no sentimental interest has been enjoyed by the battery of screw machines in the average shop. They had to produce, and that was all.

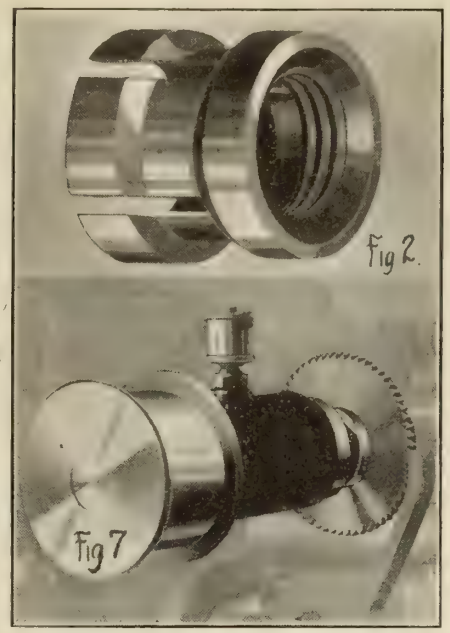

Fig. 2.—Dust cap for automobile tire valves produced on an automatic screw machine.
Fig. 7.—End milling attachment for slotting dust caps for tire valves.

Of later years the versatile qualities of the machine have demanded the attention of mechanical men, as the fields of machine shop endeavor extended. The purpose of this article is to draw attention to some of the more ingenious uses to which these machines were put, and also to mention some of the unusual jobs accomplished.

Fig. 1 shows a rear end threading attachment now being used on a No. 2 automatic screw machine. This attachment has been chosen from several rather interesting applications of the screw machine, to a variety of regular work. The job chosen is one of the commonest that a screw machine on production work, is called upon to perform—namely that of making studs. The machine illustrated is making special studs for gas engine cylinder heads. It has been working on two lengths of studs ½ inch and 7/16 inch diameter respectively. The ½ inch diameter stud is 3¼ inch long and the 7/16 inch diameter 4¼ inch long—14 and 20 threads to the inch with varying lengths of threads.

With this attachment added to the No. 2 automatic screw machine the operation of threading the rear end of the stud is completed in practically the same time consumed as in making the first thread. That is to say, the operations are going on simultaneously, and in addition, the necessity of extra handling is eliminated, as all operations are fully automatic.

The sequence of operations on the 3¼ inch stud is as follows. The bar is advanced to the stock stop. The long thread ½ inch diameter x 14 threads x 1-5/16 inch long is cut in the turret. In this case the stock is revolving in the spindle of the machine, being held by the automatic chuck, and the die head is stationary in the turret. Then the automatic swinging arm of this special attachment is lowered, and advanced over the piece. When the piece is cut off it raises it to the clamp jaws of the attachment which grip the piece while the short thread ½ inch diameter x 14 threads x ⅞ inch long is cut by the die on the attachment. When this operation is completed the clamp jaws open and drop the stud. Simultaneously with this operation of the attachment, the long thread is being cut on a new piece by the dies in the turret.

By way of further description it will be noted that the dies of the rear end attachment are held in an opening die holder mounted on a revolving spindle. The clamp jaws hold the piece stationary during the threading operation. The mechanisms that control the opening and closing of the clamp jaws, and travel of the die spindle, are governed by cams, located on an auxiliary cam shaft shown on the front of the machine. The die spindle is driven through gears by a flat belt from the overhead counter shaft. The sequence of operations on the 4¼ inch stud is similar to that on the short stud, only the short thread 7/16 diameter x 14 threads x ¾ inch long is cut by the turret dies and the long thread 7/16 inch diameter x 20 threads x 1 inch long is cut by the

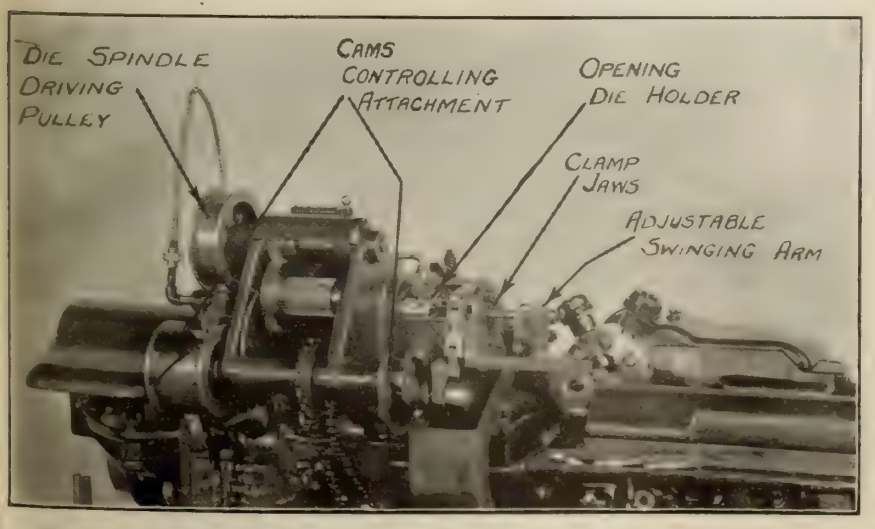

Fig. 1. General view of Machine, showing rear end Threading Attachment

*We are indebted to the Brown & Sharpe Mfg. Co., Providence, R.I., also the National Acme Co., Cleveland, Ohio, for the use of illustrations and drawings. Fig. 1, shows Brown & Sharpe machine; Figs. 2, 3, 4, 5, 6, 7 and 8, deal with National Acme work, while Figs. 9, 10, 11, 12 and 13 refer to Browne & Sharpe work.

die in the attachment. Following is the information in tabulated form.

Machine with rear end threading attachment. Piece:— automobile cylinder head studs:— material, ½ inch screw stock; length of stud, 3¼ inch; thread, ½ inch—14—⅞ inch long cut by attachment die; thread ½ inch—14—1-5/16 inch long cut by turret dies; Net Production 80 studs per hour.

Materials, 7/16 in. screw stock; length of stud 4¼ inch; thread, 7/16 inch—14—¾ inch long cut by turret dies; thread, 7/16 inch—20—1 inch long cut by the attachment die; net production 105 studs per hour.—Note net production means 10% less than gross production time being allowed for grinding tools and putting in rods when figuring time on large quantities.

Dust Cap Work

A rather unusual job for an automatic screw machine is that of a dust cap for tire valves. This was performed on a No. 52 multiple spindle automatic screw machine. The piece is shown in Fig. 2. Under actual service conditions another part is used in connection with this piece to make a complete dust cap. This additional part fits into the piece shown, and is held in place by the spring action of the split head.

In order to get efficient tooling and a high production speed, the regular arrangement of the machine was changed. The chart shown in Fig. 3. gives the various working positions of the four spindle head, the direction of rotation of the head, and the operations performed. The first change from the usual method was to arrange to have the stock fed out from the fourth position instead of in the first position. To accomplish this it was necessary to design a special attachment and in addition to provide for the cutting off of the finished part in the third position. This attachment is illustrated partially in Fig. 4 showing the cut-off side of the machine, the attachment appearing at the extreme right operating in the third position of the spindle.

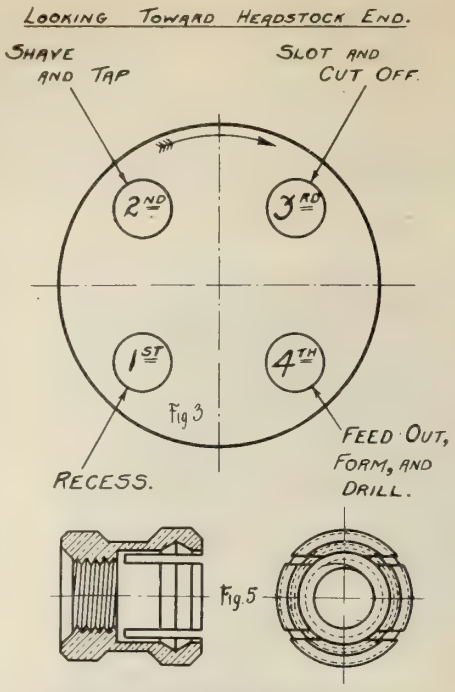

Fig. 3.—Chart of spindle positions and operations.

Fig. 5.—Cross section and end view of dust cap.

Fig. 5 shows a cross section and end view of the part being machined. The first operation, as stated before, occurs in the fourth spindle position. The solid round brass stock is fed out, and the piece formed and drilled. The forming tool is of the usual design. Owing to the two diameters of bore a combination drill is used. The same transverse motion that feeds the forming tool into the work also feeds in the cutting tool operating in third spindle position and referred to in the previous paragraph. This is accomplished by means of the "double-decked" construction shown in Fig 4.

The next operation is in the first spindle position. It will be noted that there are two internal recesses, one in the front, or slotted end, of the piece and the other at the extreme rear of the piece. A double recessing tool is used to cut the recesses. This tool is fitted in a special tool holder on the main multiple end tool holder. This small tool holder is fitted into a slide which permits of transverse motion. This tool is advanced into the work up to a stop. Previous to the arrival of the tool holder carrying the tool, at the longitudinal stop, a hardened steel adjustable projection on the tool holder in the transverse slide, comes in contact with a cam on the forming slide, and the tool is cammed over against the transverse stop, it simultaneously having longitudinal and transverse motion. Thus the recessing is accomplished and the work passes on to the second position. Fig. 6 shows the tooling for the first position.

In the second position a patented shaving tool is used to finish the work all over. This tool is operated from the top slide and is shown plainly in Fig. 6. The main end tool holder advances and feeds the tool into the work and up to a stop which stop insures accurate outside diameter. The piece is also tapped in this position. In the third position the piece is slotted by the end milling

attachment shown in Fig. 7. The pulley shown is driven by a belt from the countershaft. Two milling cutters, or metal slitting saws, are mounted on the arbor and the advance of the end tool slide feeds the saws into the work. In order to accomplish this operation the spindle must be stopped in the third spindle position. However, the design of the machine permitted of this. The spindle starts immediately after this sub-operation is completed, and the cutting off follows quickly thus completing the sequence of operations. Fig. 8 is a chart of operations.

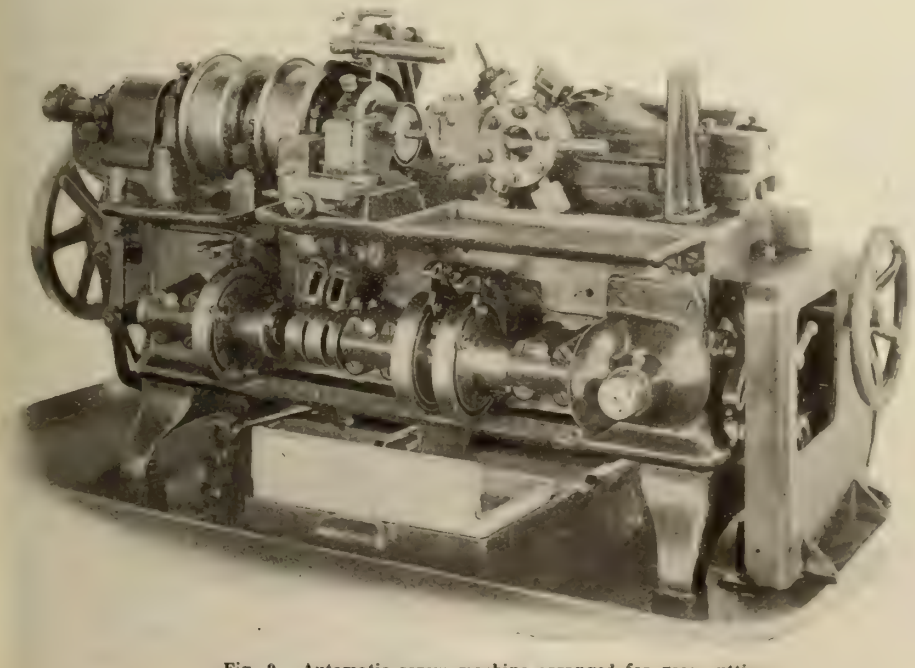

Fig. 9.—Automatic screw machine arranged for gear cutting.

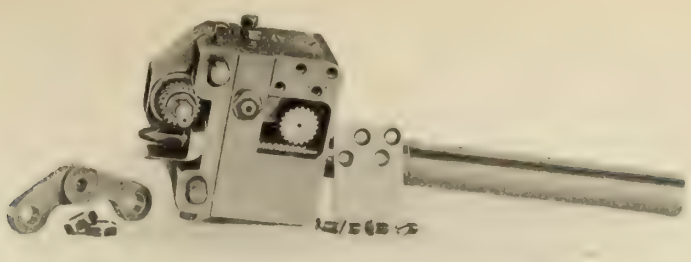

Fig. 10.—Upper view Front view of helical tooth generating tool.

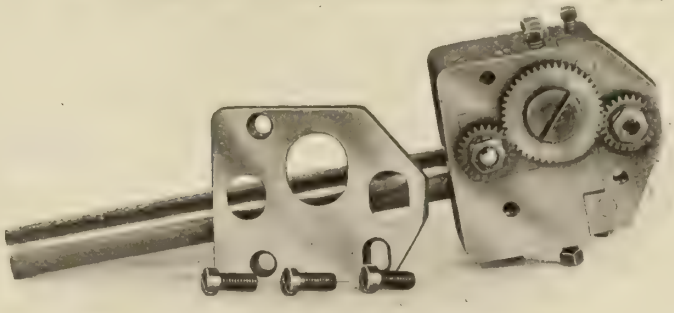

Fig. 11.—Rear view of the tool with gear guard removed.

Cutting Gears

Probably a more unusual application of the automatic screw machine is one where helical typewriter gears were cut out on one of these machines. Previous to using the screw machine to cut these gears they were produced on a small hand-operated gear-cutting machine, of special design, which machine performed the work in the same way that helical gears were cut in a milling machine, that is to say that the blank was fed forward and rotated at the same time under a revolving formed cutter. It was then returned to the starting position again, indexed, and fed forward for the succeeding cut, and so on until the gear was completed. This same type of screw machine had been successfully employed in cutting triple worms for gas meters so it was decided to attempt to tool up the machine for cutting helical gears. The machine is shown in Fig. 9 rigged up for producing gears. Figures 10 and 11 show front and rear views of the tooth generating tool and Fig. 12 shows details of its construction. The principle of its operation will best be understood from the latter engraving.

When the tool comes into action, the blank has been formed in the machine to the point shown at D in Fig. 13. The hole has been drilled and reamed and the outside diameter formed to the required dimensions. When the tool is brought up to the work the three-cornered driving centre G enters the drilled hole, and is thereby caused to revolve with the blank. As it is screwed firmly into the long driving gear H, this latter is also set in motion in unison with the spindle of the machine. Gear H has helical teeth cut on it engaging mating teeth in helical gear J, which is mounted on a short horizontal shaft having spur gear K keyed to it at the rear end. This gear, through a large idler, L, drives gear M, which is keyed to the cutter spindle S. Cutter, N, mounted on the spindle has the form of a helical gear properly cut to mesh with gear to be formed. It is made of hardened tool steel and is ground on one face, which face is set as shown in the end view, so that it is in the plane of the axis of the work. By means of the train of gearing just described, it will be seen that cutter N may be caused to revolve in unison with the work as though it were in mesh with the latter after the teeth have been cut.

Driving centre G and the front bearing of gear H are supported in a sliding bushing O seated in the body P of the tool. A plunger Q in the shank of the tool is pressed by a long and stiff spring against the end of the bearing of H. This serves to keep G pressed into the hole of the work. As the tool advances over the work, G and H are forced back with relation to the holder, remaining stationary so far as endwise movement is concerned with relation to

the work. The thrust between Q and the end of H is taken by a hardened ball pivot bearing as shown so that the friction is inappreciable. The extended lip on the bushing O is simply for the purpose of providing the long keyway shown, which engages a pin in the body P to prevent O from turning. When the tool is not in contact with the wo screw R limits the outward movement of G, H, and O produced by spring plunger Q.

Cutting the Teeth

Consider now that we have a gear blank in the machine with the teeth all cut, but not yet severed from the bar, and suppose the cutter N to be meshed with it as shown at D in Fig. 13. Suppose further that the spindle of the machine has been stopped. If now the turret slide be moved forward or back from the position shown, so that tool P is pushing forward or back over the work, centre G and gear H remain stationary with reference to the work, but move back and forth with relation to the tool holder. This axial movement of gear H will evidently rotate helical gear J, which, through the train of gears K, L and M will in turn rotate the cutter N. The ratio of this train of gearing is such that the rotary movement given to N by the longitudinal movement of the tooth-holder in either direction keeps it exactly in step with the teeth of the work. Thus the movement of the turret slide rolls the cutter on the work ju as if the latter were mounted perfectly free on its axis and as rolled by the teeth of the work itself, instead of through the train of gearing described.

Consider further, with the cutter and work set in the relation shown in Fig. 13, that the turret slide of the machine is fixed in position, but that the spindle and the work is rotated. The rotation of the gear revolves the three-cornered driving centre G, which, in turn, transmits its motion to gear H, and thence to gears J, K, L, M, and cutter N. The ratio of this train of gearing is again such that the rotary movement thus given the cutter is in the proper ratio to keep the latter in step with the teeth cut in the work, so that the work and cutter revolve together as if they were a pair of helical gears driving each other, with no connection through the train of gearing.

It has thus been shown that the cutter will be kept in step with the work if the tool is moved axially back and forth over the work while the latter is stationary. It has also been shown that the cutter will keep in mesh with the work, while the latter is revolving and the turret slide and tool are stationary. Since the cutter and work are kept in step under these two conditions separately, they are still in step when the two movements are combined. This tool and its arrangement of gearing can thus be moved back and forth over the revolving work without throwing the teeth in the cutter and the teeth in the work out of step with each other. This always supposes, of course, that the tool is not moved back so far that driving centre G loses its contact with the work, as the proper meshing of the cutter depends on the driving connection between G and the blank. If G is ever moved back out of contact with the blank, this connection is broken and when the cutter is again moved forward on to the work, it will probably be found out of step.

The action of cutter N will be readily understood now that the method of driving it has been explained. The face, as shown in the end view of Fig. 12, is the cutting edge. As the tool is forced on to the work, this revolving cutting edge, having the exact shape of the helical gear which is to engage with the work, cuts teeth of that exact shape on the blank as it is gradually forced over it. In other words, the operation is an ex-

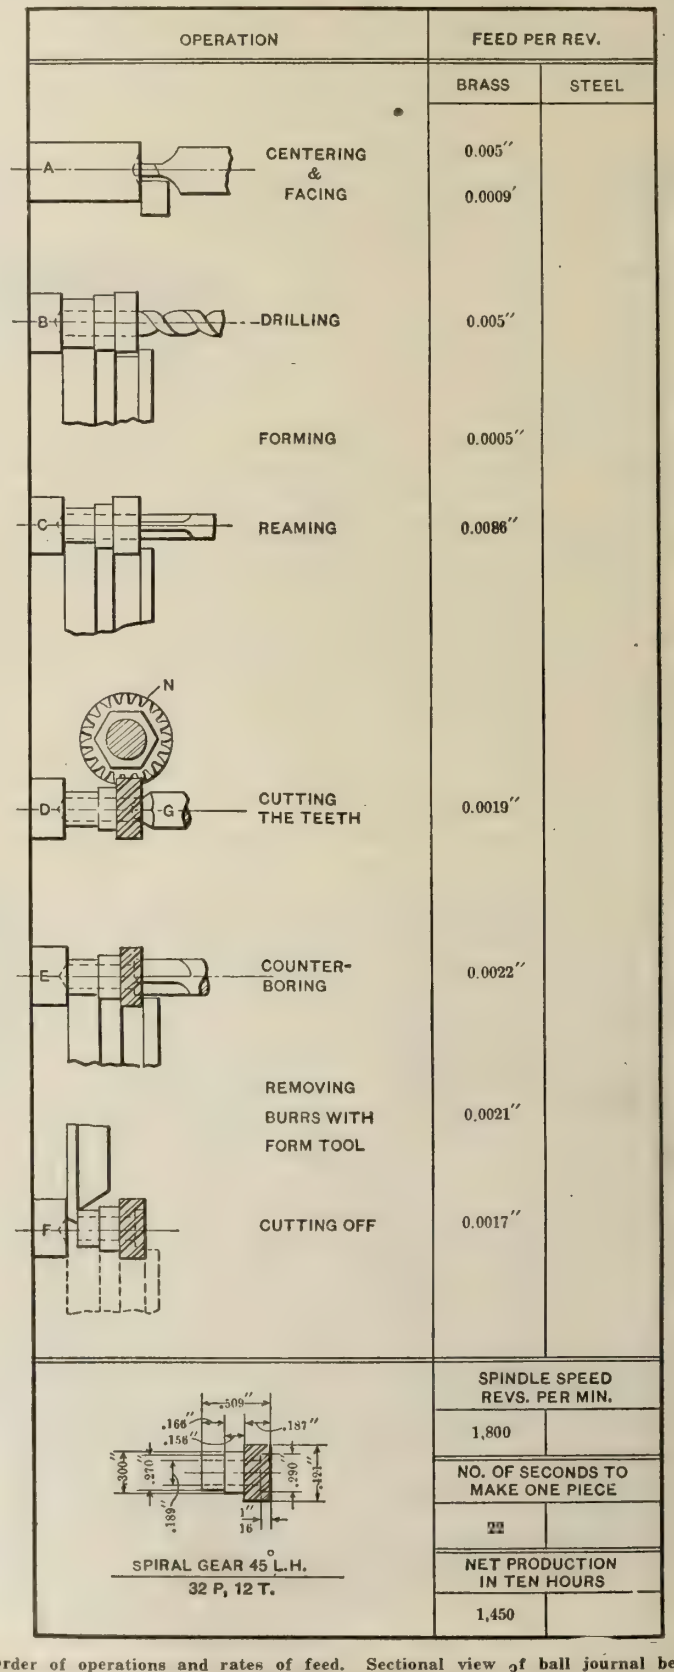

Fig. 13.—Order of operations and rates of feed. Sectional view of ball journal bearing, and a single ball thrust bearing.

ample of the molding-generating principle, the cutter N molding the proper surface to mesh with its own teeth.

The various adjustments of the tool may be understood by reference to Figures 10, 11, and 12. The shank of the tool is made very long, as may be seen also in Fig. 9. This permits the use of a spring for plunger Q long enough so that its pressure will not be materially greater when the cutter is pushed clear over the work at the completion of the cut, than when centre G first enters the hole in the work. If the pressure should materially increase, there would be danger that G might be pressed further into the edge of the hole, thus disturbing the axial relation of G and the blank, and consequently throwing the cutter and the work out of step with each other by that amount. The use of the long spring avoids the possibility of trouble on this score.

The cutter spindle S is mounted in bronze bushed bearings in front and back plates T and U, which are clamped together and to the body P of the tool by studs and nuts V. These studs, as is most plainly shown in the sectional view in Fig. 12, pass through elongated slots in the body so that the cutter spindle may be adjusted for a larger or smaller diameter of work by means of set-screws W, the adjustment being locked by nuts V. This adjustment would of course, disturb somewhat the correct meshing of gears L and M. Gear L is therefore mounted on a stud X which floats in an enlarged hole in the body and so may be adjusted by means of suitable set-screws which bring it into proper mesh with both M and K. The shaft on which the latter is mounted is also carried in a sliding block Y, by means of which gears J and H can be moved into closer or freer mesh After the cutter has been set to the proper diameter for the work, the whole system of gearing may thus be adjusted to mesh without discoverable back lash and without binding. It is advisable to have as little back lash as posible between the cutter and the driving centre to prevent the former from jumping or chattering when first commencing the cut. When there is much back lash the ends of the teeth where the cut commences are not formed to quite the proper shapes. While there is no great harm in this in the case of a helical gear, in which the contact takes place in the centre of the face, it gives a poor appearance to the work, and so should be avoided.

The thrust of the revolving work, pressing down on the cutter when the tool is in action, is taken by a ball bearing at Z. This is the only point where there would be any great danger of excessive friction so that the probability of G slipping in the work, due to too great a resistance in the mechanism it has to drive, is obviated. For the desired action, the cutting edge of the cutter must be in the plane of the centre line of work. In the tool shown, no special provision is made for maintaining this condition. As the face of the cutter is sharpened it is necessary to pack it out with filing washers. In later designs, adjustments will be provided for bringing the cutting point on a line with the centre.

The order of operations followed is shown in Fig. 13. The part to be made is shown with dimensions at the bottom of the engraving. The first operation after feeding the stock is centreing and facing, as shown at A. This is done with a tool held in the turret, and shown pointing upward to the right in Fig. 9. The turret is next revolved two holes, and the drill is brought into action. Then the turret is revolved again and the hole is reamed. The reamer is mounted in a "floating holder" seen pointing downward to the left in Fig. 9 (the turret revolves in a counter clock-wise direction.) This form of holder enables the reamer to be centred accurately, so that it will cut to size and take off an equal amount with all its teeth. While the drilling and reaming are going on, the blank is being formed by a circular form tool mounted in the front cross slide, as shown at B and C. The operation of cutting the teeth at D has already been sufficiently described. At E the hole is being counter-bored.

This counter-boring incidentally removes the marks made by the sharp corners of driving centre G. At F the completed piece is being severed from the bar. While the counter-boring is in progress, and during the first part of the cutting-off operation, the front form tool as shown at E and F is again brought down to clean off the burrs produced by the gear cutting tool.

A pair of finished brass gears made by this process mesh smoothly with each other, and appear to be finished, on the whole, rather better than would be the case had they been shaped by a formed cutter as usual. There appears to be almost no limit to the possibilities of the automatic screw machine in the hands of a resourceful designer, and this production of a set of gears serves very well as a reminder of that fact.

Steel helical gears of the same dimensions have been made at the following rate: Number of seconds to make one piece, 80; net production in ten hours, 400; also others 25/32 inch diameter 12 teeth, equal ratio, have been produced in 4½ minutes per piece giving a net production of 120 in ten hours.

ERRATA

In the Nov. 3rd. issue of Canadian Machinery, there appeared an advertisement of the J. T. Hepburn, Ltd., on Page 27. In this copy the size of the planer illustrated was given as 92 in. x 92 in. x 10 ft. This of course is the incorrect figure, for the size of the planer shown is 42 in. x 42 in. x 10 ft.

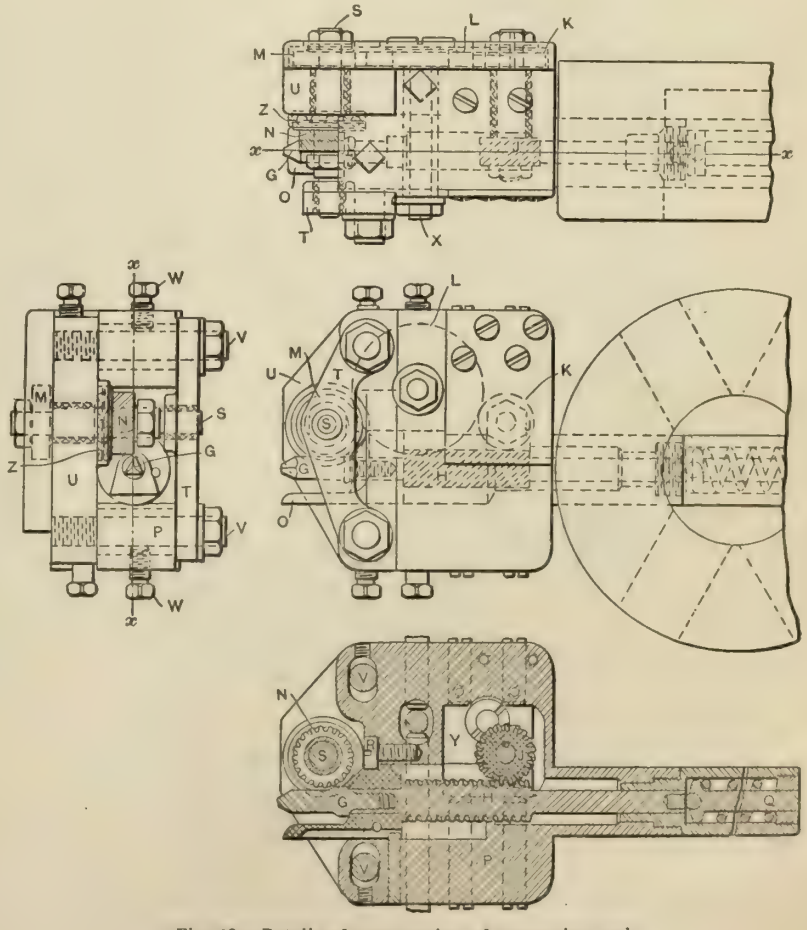

Fig. 12.—Details of construction of generating tool.

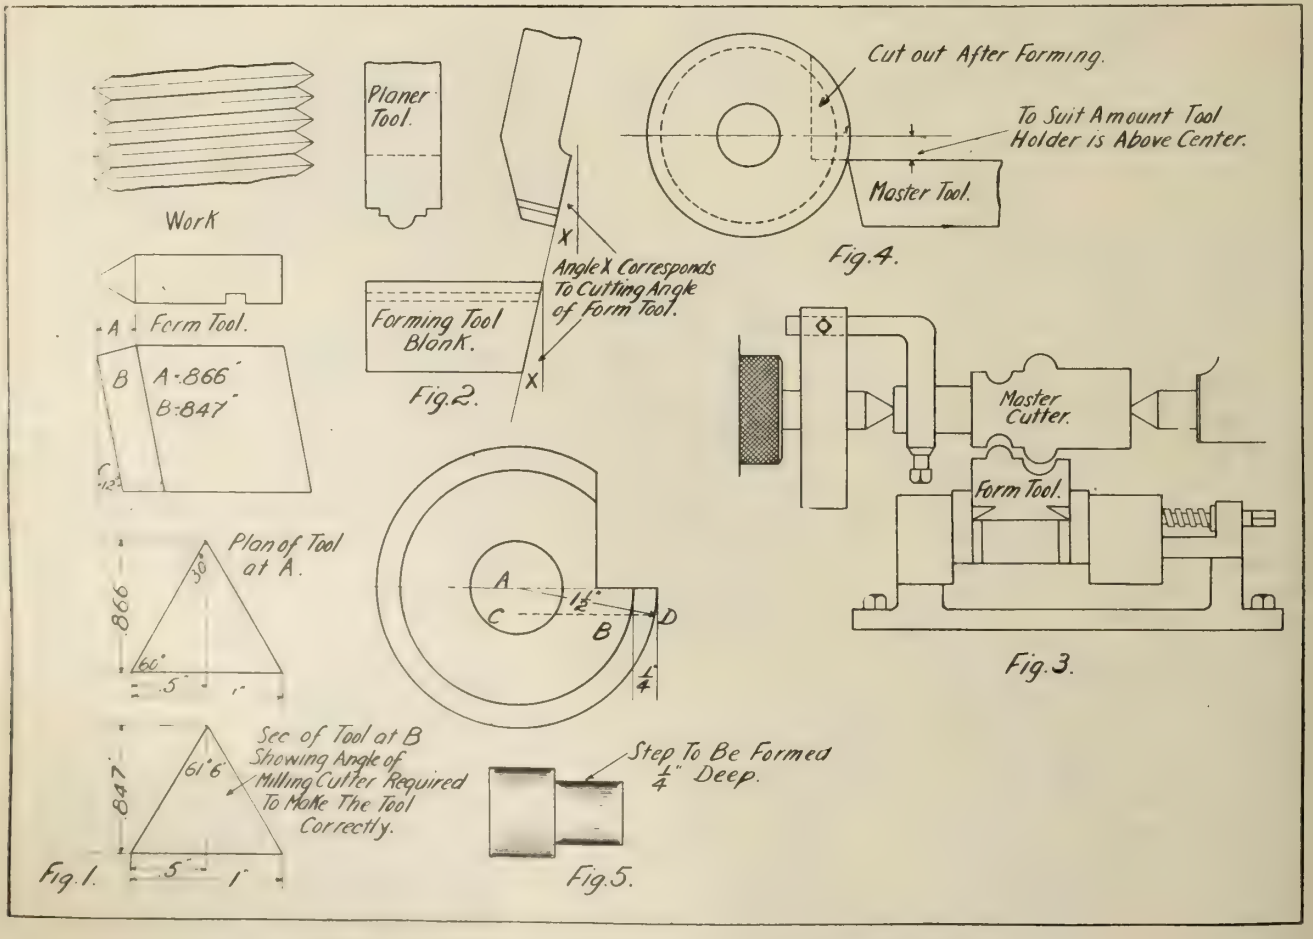
Forming Tools Require Careful Calculation

Forming Tools Especially Useful for Repetition Work — On Straight Forming Tools It Is Best to Reproduce Form by Mechanical Means—Complicated Shapes Should Be Calculated Carefully

By J. DAVIES



DURING the war, forming tools of various kinds played a very prominent part in the production of 18 pound shrapnel shells. There was the simple straight tool made to some form; the dovetailed vertical; and circular tools for copper bands, and brass nose sockets. One characteristic of the circular forming tool is that it will not reproduce its own profile, owing to the fact that in order to get cutting clearance, a piece must be cut out below the centre, then the tool raised up to the centre. This means therefore that to make a circular tool to produce work of a given size and shape, requires careful calculation.

The fact that different positions of the tool alter the size is not altogether a disadvantage because in one case we used a circular tool for cutting the wave ring which had to be turned to pretty close limits, and when the tool setter or operator would grind his tool, or perhaps a new tool was supplied, the shells would sometimes come high or low in diameter. This would generally be remedied by raising or lowering the tool. Of course in doing so we altered the form, but the difference was so slight that it did not matter. The most obvious advantage of the form tool is that the most complicated shape can be produced at once without any special skill by the operator, for if one part measures correctly, the whole form will be correct, assuming of course, that the tool is correct.

The disadvantage is that they are difficult to make and would not be economical except for repetition work. Generally, when using form tools the entire edge is cutting at once. This has a tendency to cause chatter. Forming tools are made which operate tangentially, that is instead of moving in towards the center of the work, they move in a line tangent to the outside of the surface being formed, often by means of a vertical slide and a hand lever.

Forming tools are made in many ways, the majority have no top rake. That is, they are flat on the top. This simplifies the calculations for obtaining a true form. Suppose we are to make a forming tool to produce the form shown. Fig. 1. This is a common 60 threading tool with a 12 degree clearance cutting angle. When milling the tool and measuring at right angles to the front of the tool, the depth B will be found to be slightly less than the required depth A. The difference between A and B will depend upon the angle C. The depth B will equal A multiplied by cosine of angle C. To simplify our calculations let us call the width of the tool 1., which equals the pitch of the thread and could be taken to any unit of measurement. If the tool is 60 degrees and the width at the base is one, then the depth or length A will equal .866 calculated as follows:

Bisect angle 60 making two right angle triangles with a base .5" wide and angles 30 and 60 and 90, tan of angle 60 times the width of base equals height equals 1.732 x 5=.8660 or tan x side adjacent=side opposite. Now the depth B measured from the front of the tool will equal .866 x 97815 or A times co-

Figs. 1 to 5.—Showing the author's ideas. Text matter explains each view.

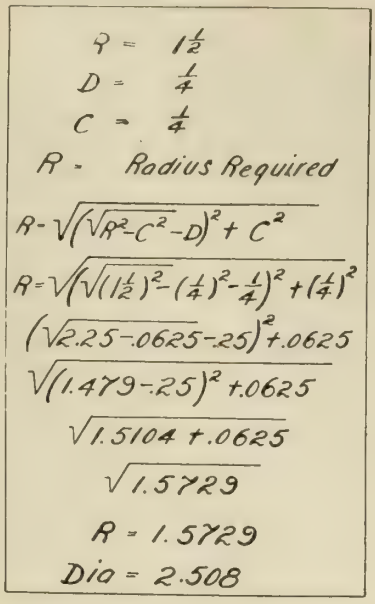
sine C=8470 so that the depth of the tool measured from the front equals .847. Now it will be noticed the width remains constant so that it is quite evident that we have altered the angle when measured at right angles from the front face. This angle represents the angle of the milling cutter required to mill the tool correctly and would be:

$$\text{Co tan} = \frac{\text{Side adjacent}}{\text{Side opposite}} = \frac{.847}{5} = .1694$$

The angle whose co tan is 1694=30° 33′ The complete angle=30° 33′ x 2 = 61° 6′.

If any slight inaccuracies developed in making the tool, these could be compensated for by altering the 12 deg. cutting angle to suit as this angle could be changed slightly without any detriment to the tool.

When a straight forming tool is to be made of a complicated shape it is best to reproduce the form by mechanical means rather than enter into any very elaborate calculations. This can be done in two ways at least. One method consists of filing a template to the required form and from this making a shaping or planing tool and fixing this tool in the shaper or planer at the same angle with the forming cutter as the latter will be afterward applied to the work. See Fig 2 Another method is to turn a piece of tool steel to the form required leaving a plain piece on each end to act as an arbor.



In making the cutter shown at Fig. 3 here is the plan adopted. The dovetailed form tool is roughed out as near as possible, then machine is stopped and the master former set at the same angle with the vertical as the form tool will stand when in operation. The master cutter is secured by any convenient means, after which a light scrape or two by hand is taken, this being accomplished by running the table backwards and forwards.

Circular Forming Tools

Circular forming tools are probably the best when conditions will allow of them being used, owing to the large amount that can be ground away before the tool is all used up. Here again if a difficult form is required it can be reproduced by mechanical means as shown in Fig. 4. Make a master lathe tool of required form and drop it as much below the centre as will correspond with the piece to be cut out of the circular forming tool. This gives the correct shape at all points.

It has already been stated that a circular form will not reproduce its own profile, neither will the steps in the tool be the same depth in the work as they are in the tool. Suppose we want to make a circular forming tool to make a piece of dimensions shown in sketch. The largest dia. of forming tool to be 3″ with a piece cut away ¼ below the centre for clearance. It is required to calculate the small dia. of the forming tool. Fig. 5 is a sketch of the forming tool with all known dimensions. The problem is to find the length of the line A B which is the radius of the small dia. of the tool. The first step is to find the angle at D in order to find the angle at D in order to find length length C D.

$$\frac{\text{Side opposite}}{\text{Hypotenuse}} = \text{sine} = \frac{.25}{1.5} = 1.666$$

Important Note: The above is not quite correct. Reading from the third line from the bottom, here is how it should be reproduced—R equals the square root of 1.5729, therefore R= 1.254. The last line on cut is correct.

The angle whose sine is 1.666 is 9° 34′ and the co sine of this angle is .9869.

The side adjacent to this angle which is the length C D = hypotenuse x co-sine. Hypot. x co sine. = length C D= 1.5 x 9860=1.470. The depth of the cut B D subtracted from length C D = C B = 1.479—.250=C B=1.229. Side adjacent which is length C B divided by side opposite which is ¼ equals co-tangent of angle B. 1.229 ÷ 25 co tan of B 4.9916. The angle whose Co tan is 4.916 is 11° 30′ and the sine of this angle is .19937. Divide side opposite or ¼ by sine of angle B length of A B which is the radius of dimension required

$$= \frac{.25}{19937} = 1.254 \text{ Rad.} = 2.508 \text{ Dia.}$$

A formula given by machinery for the same work is: H R=largest radius of tool; D=Difference in radii of steps on work; C=Amount cutting edge is below center; R=Radius required, which worked out on our example gives the same results.

The Winnipeg Motor Car, Ltd., of Winnipeg, Manitoba, have acquired three acres of land in this city for a three story building large enough to turn out 55 cars per day. The company have been working all summer getting it into shape and they expect to be producing by the first of the new year.

BALL AND ROLLER BEARINGS

(Continued from Page 28)

this bearing should be concentric with the bore and of the housing carrying the adjacent journal bearing. The faces of the recess must also be perfectly square with this bore. This type of thrust bearing being mounted on a sleeve in a unit makes it very desirable to use and easy to install.

Fig. 8 shows the application of ball bearings to loose pulleys, and it is on this work that they show to particular advantage. Their perfect reliability and suitability for grease lubrication mean that the bearings can be neglected for long periods without the slightest harm, provided they are properly fitted and lubricated in the first place. Where the belt is constantly thrown off and on the loose pulley, the use of ball bearings reduces considerably its wear and tear. The method of applying the bearings is very simple: The outer races being the revolving members should be a tight fit in the hub of the pulley, and should be clamped endways by means of the distance piece and spigotted end covers. The inner race of one bearing is fixed by means of an adaptor sleeve and nut. This bearing locates the pulley.

A thin sleeve or bushing should be tightly fitted to the shaft, and the parallel bore of the other bearing made a nice push fit on this sleeve. This inner race must not be clamped endways, and, while it must not be a slack fit, it must be able to align itself opposite its outer race. If this cannot happen, a permanent end thrust is put upon the bearing which will ultimately cause its destruction.

A SIMPLE TIPPING GEAR

The number of devices invented for raising the body of a wagon so that its contents may be tipped out on to a dump is legion. Most of the forms adopted are slow in action if they are simple, and if the action is rapid the mechanism is very heavy and complicated, especially where side tipping as well as rear tipping is required. Some interest therefore will be taken in a new solution patented by a British firm. It consists simply of an ordinary jack fixed on the chassis immediately beneath the centre of the body, and operating in a ball-and-socket joint which enables it to tilt in any direction as the jack is raised or lowered. The body rests on hinges which can be adjusted for side tipping—to either side—or for rear tipping. When the wagon has to be tipped all that is necessary is to arrange the hinges in a suitable way and operate the jack by means of the engine on the car. The jack in rising pushes the body over towards the side where the hinges remain fixed. The operation is quite rapid; and in the event of any breakdown of the power the mechanism can be operated by hand. The only additional weight which this invention involves is the weight of the jack and the girders fixing it to the chassis.

Proper Heat Treatment for High Speed Steel

Steel Being Raw Material Should Receive Careful Study—Danger of Improper Heat Treatment — Object of High Temperature Furnace—Quenching the Tool—Care is Big Essential

*By J. L. THORNE

THE ART of heat treating high speed steel is the most important branch of the cutting tool industry. It is even of more importance than good steel, careful designing, or of any other individual step in the process of manufacture, for the reason that heat treating is usually one of the last operations, and all the good qualities that a tool might have possessed are readily destroyed in a greater or less degree by improper heat treatment. Realizing the importance of this operation, close attention should be given to every detail which will enable the operator to insure reliable results.

Steel being the raw material from which all tools are made, should receive careful study and that grade which is best adapted for the particular purpose in mind selected. Many steels on the market today have adopted what is practically a standard chemical composition. This composition was selected because for standard work it has proven itself to be good. However, let us not make the mistake of being too conservative by refusing to try any new steel or alloy which may possess merit to a high degree. From the heat treating point of view, it does not matter by which process the steel is made, either the crucible or electric. Both methods make good and poor steel, depending entirely upon the skill and knowledge which are used in its manufacture. In a general way the chemical composition of high speed steel is as follows:

	Per cent.
Carbon	0.60-0.70
Silicon	0.20-0.30
Sulphur	0.025 maximum
Phosphorus	0.025 maximum
Manganese	0.25-0.35
Chromium	3.25-4.00
Vanadium	0.25-1.00
Tungsten	16.00-18.00

Before going further, it might be well to consider the effects of these different elements upon the steel. Silicon when too high, causes a brittleness by forming a silicon of iron which is not appreciably dissolved in the steel and acts in much the same manner as any foreign inclusion. Manganese is of great benefit to the steel, in that it readily combines with the sulphur and reduces to a minimum the damage this element would do if left to combine with the iron. Manganese, however, is nearly always in excess of that needed to combine with the sulphur and the remainder unites with the carbon to form manganese carbide, which is one of the compounds which in part hardens tool steel.

Sulphur, if left uncombined by the manganese, would form a compound with the iron which would be of a very brittle nature. As stated before, however, it is seldom in excess of the manganese and is injurious for the reason that manganese sulphide does not enter into the solid solution, but separates out as an inclusion in the steel. Sulphur causes steel to be brittle when hot, and if too high it is impossible to work the steel through the rolling mills, and necessarily scraps the ingot. Phosphorus unites with the iron to form a phosphide which often segregates and causes the other compounds, such as the carbides, to become segregated, and it is said to be one of the chief causes of ghost lines in steel. Phosphorous also causes the steel to be sensitive to shock.

Chromium does not materially alter critical range, although it has been claimed to slightly lower the upper critical points. This element in conjunction with the carbon, is mainly responsible for the extreme hardness of high speed steel. It is very influential in causing the steel to be hard on relatively slow cooling after being heated through the critical range, and it also imparts a secondary hardness on being reheated to a temperature under the critical range. Vanadium was originally used as a scavenger of the steel to remove the slag impurities and to reduce the amount of nitrogen held occulted in the steel. However, it is now proven that this element adds some very desirable qualities to the steel. It increases the elastic limit and greater resistance to wear and shock, allowing the steel to have a higher cutting rate when properly heat treated. Tungsten slightly raises the critical range and unites with the carbon to form a double carbide. This element increases the desirable effects of chromium and imparts the high degree of red hardness which makes our high speed steel so valuable.

While this does not begin to exhaust the effects due to these various elements on the steel, it, in a general way, gives some idea of what the steel is composed and why the various elements are added. It also explains why the tool manufacturer lays as much stress as he does on the importance of purchasing steel of a specified analysis. On the whole the chemical analysis of the steel has no direct bearing on the heat treatment it will receive, aside from the fact that these various elements cause a change in the position of the critical range. The critical range itself is of secondary importance. The main fact which the heat treater should know is the temperature necessary to cause the various elements to enter into the solid solution and form a homogeneous compound. The following treatment is for the usual high speed steel on the market, and as the composition varies with higher or lower percentages of alloys, the heat must be varied to meet the new conditions. With high speed tools which are cast to shape the heat treatment is altogether different in every way, from that described. It was because of our trying to heat-treat cast tools in the same manner as we had formerly heat-treated tools made of bar stock that we had encountered many failures and very uniform results. After a careful study of our cast tools, a new method for heat treating was worked out.

Improper Heat Treatment

To illustrate some remarkable instances of what improper heat treatment may cause even with a high-grade metal it may be well to give some of the results from the usual heat treatment given high-speed steel on cast tools and compare them with the results now obtained, using an altogether different method. In heat treating tools cast to shape as ordinary high speed steel we found, as did many others, that breakage was very high, due to hardening strains, and to the reason that cast tools do not have the fibrous structure that steel which has been hammered and rolled has, and, of course, if no corrective measures are taken, is of a brittle nature. This has been overcome by heat treating and in course of time, when some existing experiments have been completed showing the relation of cutting ability to results from impact tests, tensile strength and elastic limit in conjunction with the hardness of the tool, we hope to present this information for your consideration.

Even with our limited knowledge of the cast iron tool industry, we have obtained cutters which will uniformly do the following work: a 6x1 inch milling cutter was used and the material cut showed a shore hardness of 38, the speed was 83 revolutions per minute, or a cutting speed of over 130 feet per minute, depth of cut 1 inch feed, 16 inches per minute. This means we can remove 16 cubic inches per minutes, or one cubic foot in little over one hour and a half.

Heat treating of commercial high speed steel consists essentially of first preheating the tool; second, raising it to the high temperature; third, quenching, and fourth, reheating, drawing or tempering. To accomplish these four operations successfully the form of the fur-

*The author is metallurgist at the High Speed Tool Corp., New York, and presented this material before the Philadelphia convention of the American Society for Steel Treating.

nace should be carefully considered in its relations to the type of the tool to be hardened. For the purpose of this article, we will take into consideration such tools as are properly hardened in an oven-type furnace. This would include all milling cutters, blades, forming tools, etc., which are to be hardened all over.

The purpose of preheating is to raise the temperature to some point below the critical range, so that on its introduction into the high temperature furnace, it may acquire that temperature as quickly as possible. While it is necessary to leave the tools in the preheating furnace for some little time, care must be used that as small an amount of scale as possible is formed on the tool. The reason for this is that the scale when heated to a relatively high temperature is reduced again by the carbon of the steel and causes a decarbonized surface. There are many cases where the steel has been condemned for this soft or decarbonized surface, which was entirely due to an improper atmosphere within the furnace, this causing the scale. It has been found that smaller tools of delicate shape could be preheated to as high temperature as 1700 deg. Fahr. with good results, as it is not necessary to hold these pieces in the high temperature furnace for as long a time as would be necessary had the temperature been lower in the preheating furnace. In general, experience has proven that the higher preheating temperature gives better results than by following the older methods which use approximately 1500 degrees Fahr. for all preheating work.

The main points to be considered in the preheating furnace are: first, uniformity of heat; second, temperature to which the piece is to be raised; and third the atmosphere within the furnace to obtain the least possible amount of oxidation of the tool. In preheating the tool, it should be brought to the temperature slowly, as this will eliminate the danger of checking the steel due to the uneven expansion of the tool. This is especially true of tools which are not of uniform cross section. From the preheating furnace the tool is now transferred as quickly as possible to the high temperature furnace.

High Temperature Furnace

The object of the high temperature furnace is to cause the various elements in the steel to enter into a solid solution in the quickest possible time. The reason for haste is that as soon as the steel passes the critical range, grain growth sets in and the smaller we can keep the grain and at the same time acquire a homogeneous solution, the better service we may expect from the tools. Excessive grain growth causes brittleness in the tool and drawing even at high temperature cannot correct this, although it may mitigate the brittle nature to some extent. On acount of this grain growth, the preheating should be as high as possible but lower than the critical range and the temperature of the high heat furnace considerably higher than that to which the tool is to be brought. For ordinary high speed steel a furnace temperature of not less than 2350 degrees Fahr. and as soon as the operator is able, this should be raised to 2375 degrees Fahr. or even higher. At this temperature the steel would soon be destroyed if left for any considerable time, and must receive careful attention and removed the instant the fine cutting edges acquire the proper temperature. The usual method to determine the proper time to remove the tool is to watch for the metal to sweat or small bubbles to appear on the surface of the tool. This method is good, but a better way for the careful observer is to watch the thin section of the tool and when the tool is ready to be removed a faint but noticeable intensity of color is observable. This increased intensity lasts but a very short time, and if not observed, there is danger of the tool being overheated. It resembles in many respects the recalescence of plain carbon steel, and is no doubt due to some changes taking place in the steel. The Tungsten carbide will go into solution at a temperature much lower than has been recommended in this paper, but it is sluggish and to get it in solution takes time, allowing grain growth, although for the heat treater who has had little experience with high speed steel it is no doubt safer even if it is at the expense of the cutting ability of the tool.

Heat Cutting Edges

It is of prime importance to heat cutting edges to get even uniformity, etc. To accomplish this, it is necessary to resort to many little tricks. All tools should be moved so that both sides shall attain the same temperature and for milling cutters, the writer has found that a block of pure nickel upon which they may be placed so that the cutting edges extend over the edges of the block assists in bringing the tool to a uniform heat. Tools which have a large and small cross section may be brought to heat evenly by protecting the thinner sections with asbestos for a portion of the time and removed so that all parts acquire the temperature necessary at the same instant. Angular cutters may be placed with the thin section next to the hearth bottom and are thus protected by their own mass and the thin sections are the last to acquire the necessary temperature.

Where many pieces are treated daily, the scale from the tools falls to the hearth and in the high temperature soon fluxes with the hearth to form a thick slag which does not help in heat treating and more often damages the fine cutting edges by promoting fusing of the steel. This slag often adheres to the tool after quenching and when it is sand blasted enough to remove this slag the cutting edges often suffer. When the hearth gets bad a sheet of asbestos covering the hearth will help considerably, although it requires renewing almost daily. In connection with the hearth, it has been found that carborundum is much better than the ordinary fire clay. The cost is two to three times as much, but gives nearly ten times as much service. In one heat-treating room the bottoms made of fire clay lasted on an average ten days. Carborundum hearths were tried, and they gave better than three months' service. This, when the time lost in renewing the hearth is taken into consideration, more than paid.

Another source of trouble in the high temperature furnace is protection tubes to withstand a temperature of 2300 degrees Fahr. or higher. Most of the alloys on the market fail to stand up for any time at all and the refractory tubes have numerous faults. In the first place, it is hard to introduce a new protection tube into a hot furnace without first preheating on account of breakage, due to the expansion of the tube. Even when put in a cold furnace and brought up to heat with the furnaces, they sometimes break for this reason. Another bad feature is that they are easily broken by being struck by the work in the furnace. As a substitute for the various protection tubes on the market using pure nickel tubes made from nickel bars with the holes drilled or bored is suggested. Cast nickel tubes were tried and while they were far superior to any that had been used before, they gave less than half the service the bar tubes gave and were more or less porous. The bar tubes have given service for three to nine months where the temperature used was from 2350 to 2385 degrees Fahr.

Quenching the Tool

The tool having been brought to the desired temperature and the steel being in a solid homogeneous solution, it is necessary to quench the tool so that it is cooled quickly, thus the complexed hardenites do not have time to separate out an acquire that form in which the steel would be soft. Fortunately for the heat treater this occurs in high speed steel at a comparatively slow rate and even cooling air is rapid enough to retain these hardenites in the form that will render the steel hard. However, to follow the practice a large amount of scale forms which reduces the size of the tool, causes pitting and in many ways impedes subsequent operations, however, it is still sometimes used, more especially in Europe. To overcome these objections the tools formerly were immersed in oil when removed from the high temperature which cooled fast enough to keep the steel hard. There are many objections against the use of oil, however. Some of these are: Fist, the oil often takes fire when large quantities of hot metal are quenched and unless expensive cooling devices are installed is dangerous. Second, the oil cools the tools too quickly and often causes the tools to check, especially when of uneven cross area. This is especially true if the oil contains moisture and water often gets into the oil from the water jackets usually employed to keep the oil cool. Third, the oil becomes spilled or drips off the tools when they are removed and in this respect is dirty and causes the floor to become slippery, which is dangerous to the workmen.

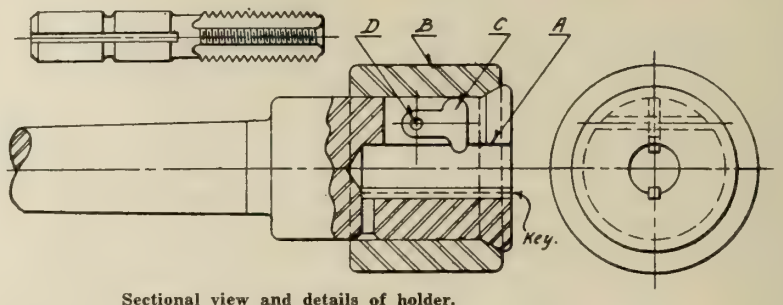
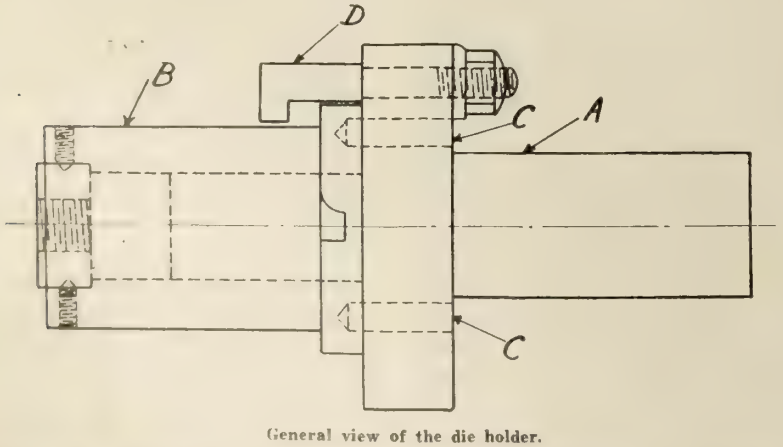
WHAT OUR READERS THINK AND DO



RELEASING DIE HOLDER



By Harry Moore

A solid shank for this type of tool, is to my mind well worth while. As a general rule the "home made" variety die holder has a weak shank, due to the fact that it is bored clear through to receive the shank of the revolving holder. This, in many cases, causes trouble when the holder is tightened up in the turret hole. If it should be tightened too much, the holder will not revolve easily as the hollow shank has a certain amount of spring, or on the other hand if it is not tightened sufficiently the holder will come out of the turret hole badly when backing out the die.

An easily made die or tap holder of the solid shank type is shown in the sketch. The die holder B, is made in the form of a sleeve running on the front portion of A. When the die is cutting, the thrust is taken by two pins CC, (driven tight into the shoulder of A) engaging with two holes in B. A hook bolt D, tightened securely to the shoulder of A, and running into the slot cut in B, serves to back the die off the work when the machine is reversed. The end of the hook bolt D, is rounded off to facilitate its slipping into the slot in B, without knocking.

Sectional view and details of holder.

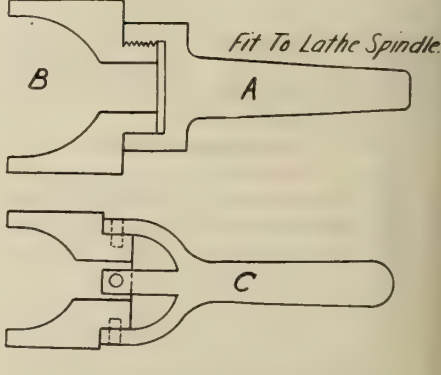
General view of the die holder.

COLLET FOR HOLDING TAPS AND OTHER SMALL TOOLS

By F. S.

The accompanying illustration shows a simple arrangement which may be used for holding such parts as have a round shank, and which may be held in a drill press. Its object is to permit of quick removal of the tool from the collet. The shank of a tap would have, for instance, a keyway and round groove cut into it as shown in the sketch, and this is slipped into the hole A of the collet.

While this is being done the bushing B is held up by hand so that the small hinge piece C will be allowed to swing out of the way when the tap is being put in position. The collar B is then forced down over the hinged piece C, which is carried in a slot in the body of the holder hinged on a pin D. This hinged piece enters the groove on the tap and prevents it from falling out; the keyway driving the tap efficiently. Collets of this type may be used for drilling and other purposes.

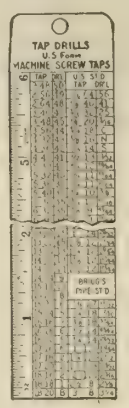


TREATMENT OF STEELS

According to directions supplied by the Consolidated Steel Corporation, American producers of tool and alloy steels, for the treatment of their high-speed material, in cutting tool lengths from bars of high-speed steel the bar should always be heated at the cutting point to a yellow color corresponding to a temperature of about 1750° to 1850° F. The bars should never be cut cold. For forging, the material should be slowly and uniformly heated in a clean fire, or furnace, to 1750° or 1850° F. (a yellow color), allowing sufficient time for the heat to penetrate to the centre of the piece. The tool should be reheated when the temperature falls below 1750° Fahr.

MACHINING A BALL

By G. Russell



The accompanying drawing shows the tools used to finish some steel balls in the lathe. First a piece of steel is turned as round as possible by the ordinary method, taking care to remove the usual tit. Next the tool A is placed in the lathe spindle, and the ball placed in B. Next bring the hand tool into operation; it is placed over the ball. The lathe is started and by using a little pressure, and an oscillating motion, the ball is soon finished. The pressure should be released occasionally, in order to let the ball take a slightly different position. If proper care is taken, such a ball can be made within .001 inch. of being perfect.

The tool used to turn ball.

Have You Tried This Contest Yet? If not--- Do so Now

Below will be found twelve references to advertisements in this number. To the sender of the first correct set of answers to these we will forward one of these scales.
To win one is not difficult, and at the same time you will add to your store of knowledge. Read the details given below.

The scale is 6 in. long and is made from finest quality steel. One side is marked in 32nds, the other side in 64ths. A table of decimal equivalents is also stamped on one side, and a table of tap drill sizes on the reverse side. This scale is well worth securing.

What You Have to Do

We publish every week a number of interesting facts or statements selected from the advertising pages for that week. The selections for this issue are given below. Read these through, then turn to the advertising section and see if you can pick out the advertisements to which they refer. The work is interesting, it will train your powers of perception and of memory, it costs you nothing, it will make you better acquainted with the various lines of machinery and tools in the market, and with perseverance you are bound to win one of these useful scales as a prize.

While many contestants had 11 answers correct in the Oct. 20th contest, not one had the list of 12 correct. Question No. 12 was the puzzle. It read "A Pretty Strong Statement." Read page 3, Oct. 20th issue, and glance over the first five words of the Nicholson File Co. advertisement. It's a mighty strong statement to our way of thinking.

CONTEST FOR NOVEMBER 10th ISSUE
Contestants are required to write us, stating to which advertisements we refer in this number.

1—A machine that is special.
2—Something which gives you both speed and balance.
3—A machine which performs seven distinct duties.
4—How to get something analyzed.
5—Something that is quiet in operation.
6—How to avoid useless waste of effort and time.
7—A process that reduces waste.
8—A development of 74 years.
9—Something that is specialized in.
10—How to secure pithy information.
11—Something used by large manufacturers.
12—How to keep up-to-date.

These are Correct Answers for List from October 20th Issue

1—L. S. Starrett Co.
2—The American Pulley Co.
3—John T. Hepburn Ltd.
4—Cleveland Pneumatic Tool Co.
5—The Heald Machine Co.
6—H. H. Robertson Co.
7—National Acme Co.
8—Murchey Machine & Tool Co.
9—H. W. Petrie, Limited.
10—Canadian Hart Products Co.
11—Aikenhead Hardware Limited.
12—Nicholson File Co.

Closing Date for This Contest is December 1st.

Development of Welding Methods

WELDING methods have been developed in a marvelous manner during the past few years. Many improvements to torches, equipment, etc., have been added, and now we have a new form of oxy-acetylene torch, which according to "La Nature," has been developed in the French Navy in the process of salving vessels lost during the war. A small bell-shaped vessel surrounds the oxy-acetylene flame and is kept supplied with compressed air. After the flame is alight and the stream of compressed air established, the torch may be plunged into water without being extinguished. If by accident the original form of blow-pipe was extinguished, it was necessary for the diver to ascend to the air to light it again. A tube containing an alkaline metal and an oxidiser is now attached to the torch, and can be moved to the mouth of the bell. On removing the cap from the end of the tube the chemical action of the water on the mixture produces a flame which re-lights the torch. The addition has greatly increased the number of underwater uses to which such a torch can be put.

Tests on Hollow Steel Casings

A PAPER issued by the Bureau of Standards at Washington gives an account of the tests on six hollow cylindrical steel castings manufactured by the centrifugal process. The castings were 6ft. long and of diameters up to 18ins., with holes of various diameters through them, and they were made with the mould revolving about the axis at a speed not specified in the report. Samples of the metal taken from different parts of the complete castings were tested for hardness, tensile strength, soundness, structure, and density, both in the condition as cast and after heat treatments of various kinds. It was found, says Engineer, that there was a slight segregation of carbon, phosphorous, sulphur, nickel, and copper in the radial direction, but none of manganese and silicon. Small blow-holes were evident in the inner 1/16in. of the castings. After heat treatment several of the castings showed mechanical strength equal to forged materials of the same composition, and satisfied the ordnance requirements for gun forgings. Microscopic examination showed no hard spots, flaws, or other defects outside the layer 1/16in. thick at the inner surface, and the process appears to be one of great promise.

The Annealing of Aluminum

ALUMINUM castings such as oil pans of motor cars are somewhat difficult to weld when broken, owing to the liability of the part drawing out of shape while cooling or cracking owing to the locked-up stresses. If the part changes shape much it will be impossible to reassemble it, and if held rigidly to a steel frame while cooling off so as to maintain the original form there is danger of cracking.

One of the most effective materials for insulating aluminum castings and for insulating preheated aluminum castings and preventing cracks while cooling down is dry soft wood sawdust, says Autogeneous Welding. The sawdust should be used liberally, covering the welded casting to a depth of say two inches. If dry it is an excellent insulator, and if the casting is quite hot it is likely to take fire and smoulder slowly, thus extending the cooling period considerably. An aluminum casting so treated will be annealed so soft when cooled that it can be bent without fracture.

In this connection it is of interest to note a method employed by coppersmiths to anneal large copper and brass sheets and keep them flat. The same method is used for aluminum and monel sheets. After being heated the sheets are laid between dry pine boards and left to cool. The boards are excellent heat-insulators and as the wood chars and smolders for a time the slow combustion helps to maintain the heat. The sheets cool very slowly and when finally cool will be found soft and easily bent.

Lubrication of Railway Axle Boxes

AMONG various experiments with oil, a system of splash lubrication for railway axle-boxes is described in a recent issue of Railway Review. Near the bottom of the box, and hinged at the back end, is placed a plate or flat bar, its hinge permitting movement in a vertical arc and its outer end—near the front of the box—being seated on a coiled spring. Holes in this bar are fitted with hollow cones, the ⅛ in. apex openings of which are just above the top of the bar. A small roller or wheel having its axis parallel with that of the carriage axle is mounted in bearings on the bar and runs in an opening cut in the bar. To the end of the axle an eccentric disc or cam is attached by a tap bolt, the throw of the eccentric being ⅛ in. or ¼ in. This eccentric rides in contact with the wheel on the spring bar, so that at each revolution the end of the bar is depressed, and the oil which fills the lower part of the box is thus squirted up through the cones to strike the journal. To provide for lateral movement of the axle within the axle-box, the bar roller has a travel of about 1¾ in. along its shaft.

Another mechanical lubricating system employs loose waste to distribute oil which is pumped to it from a reservoir at the bottom of the axle-box. No change in box, brasses or journals is required. In this design the pumping is effected by the lateral movement of the journal and axle, a stud bearing against the end of the axle transmitting this movement to the short upper arm of a vertical lever. The lower end of this lever gives a corresponding but longer movement to a plunger in the oil reservoir, thus forcing the oil up into the packing. An advantage of this latter arrangement is that in case of the mechanism becoming inoperative, the oily waste would still continue to lubricate the journal. In tests held it was found that this lubrication was sufficient for about 150 miles, after which the journal began to heat.

DEVELOPMENTS IN SHOP EQUIPMENT

CONSTANT SPEED MILLING MACHINES

The Oesterlein Machine Company, of Cincinnati, Ohio, have introduced a complete line of milling machines of the constant speed, or "all geared" type. The new line consists of No. 1, No. 2, No. 2 heavy, No. 3, No. 3 heavy and No. 4 sizes, each size being made in plain and universal. The fundamental idea underlying the design has been to produce a machine with all of the features essential to modern milling and to secure these features by reducing the number of parts of the minimum and increasing the strength of the necessary parts to the maximum.

The speed mechanism consists of 15 gears from which 16 geometric speeds are obtained. Only one shaft is employed in addition to the spindle and the pulley shaft. In obtaining 8 of the 16 spindle speeds, power is transmitted through a three or four gear train. It has been found unnecessary to secure any of the 16 speeds by means of quadrants, or similar mechanisms. This simplification of speed mechanism shows its results in the low power consumption of the machine. The no-load power loss of a No. 2 machine varies from 124 watts (.18 h.p.) to 226 watts (.30 h.p.) between the extreme spindle speeds of 16 to 384 revolutions per minute. This power loss included the feed box at the highest rate of feed and feed mechanism within the knee and may therefore be regarded as practically the entire no-load power loss of the entire machine.

The speed changes are secured by means of "two position" levers and a "four position" knob. The "four position" knob controls the selection of four adjacent spindle speeds. All speed changes may be made without stopping the machine. Every gear is made from low carbon forgings that are put through an annealing, carburizing and hardening process. All gears are sandblasted to remove furnace scale and the wire edge of machining operations is removed in order to protect the bearings. The automatic lubrication of the machine is effected without pumps or any extra moving parts. This is accomplished by a system of three reservoirs. The first reservoir is cast in the top of the column, aside the overarm. Into this reservoir clear, fresh oil is poured. This oil seeps through felt down tubing to cavities cast under the main spindle bearings, from there to the intermediate shaft bearings and driving pulley.

Wicks dip into the cavities under the spindle and carry oil to the spindle bearings proper.

The driving pulleys are 14 inches in diameter, and run at 400 revolutions per minute. Practical use is made if the high belt velocity by controlling the operation of the machine by tight and loose pulley. A brake for quick stopping of the spindle is designed into the belt shifter in such a way that the belt is partially carried to the loose pulley and the brake applied to the tight pulley by a spring plunger release. The feed box is driven off of the pulley shaft, producing feeds in inches per minute. A phosphor bronze of from 28 to 32 points scleroscope hardness, is used for all bearings and feed nuts throughout the machine. Cumberland ground steel of 45 to 50 point carbon is used for table, cross and vertical screws. The feed box, knee and table are similar to the design developed by the company and used in their cone type milling machines.

IMPROVED SCLEROSCOPE

The Shore Instrument & Mfg. Co., New York, have marketed an improved Scleroscope model C1. The refinements made so increase the flexibility of the operating mechanism that it will give more uniform service even though the adjustments are comparatively approximate, and the works conditions, including the skill of the operator, are less favorable. Among the features are a special fine screen for eliminating dust from the operating mechanism. The leather operating piston formerly used, has been replaced by one of tungsten steel, which is practically indestructible The former rigid adjustments of the hammer hook mechanism has been replaced by a flexible adjustment which also greatly prolongs the life of the glass tube. The hammer hooks have been provided with shock shoulders, which eliminate breakage of disalignment of these parts. In addition, more highly perfected glass tubing is being employed.

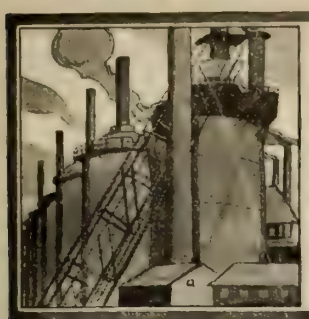
Ball and Roller Bearings

ON another page of the present issue appears an article on ball and roller bearings. This will appear in two parts and will show various applications to machine tools, and should interest not only the mechanic and designer, but the manufacturer as well.

In a large manufacturing plant, where considerable hand trucking was done, it was decided to equip a few trucks with ball bearings as an experiment. Certain heads grumbled at this move, stating that the cost of such bearings was too much in comparison to the total cost of building an ordinary truck with plain axle. After a week's trial with the ball bearing trucks, the grumblers turned to boosters, because results showed that first cost was a very small item compared wi the saving in time and energy effected. The amount of material moved increased, the men operating the trucks did not tire so easily, and the wear and tear was less. Everyone was satisfied, and all other trucks were similarly equipped.

What is true of trucks is likewise true of other plant equipment. Where friction has to be overcome, ball or roller bearings are a good medium to employ. Many machine tools of the present day would not have reached their existing state of perfection, were it not for some type of friction-reducing medium. It is a well known fact that friction is the start of many troubles, therefore by using ball or roller bearings we eliminate the cause of these troubles. Wherever a shaft revolves, it pays to make the task of turning that shaft as light as possible.

Designers of machine tools, and kindred mechanical equipment should make it a point to become thoroughly conversant with the uses and application of ball and roller bearings. They should seek information from all possible sources, and there is no better way to get this than from men who have made a study of the subject. Never be ashamed to ask for information. The writer of the present editorial sought light on a ball bearing application on one occasion, and in a very short time a manufacturer had pointed out a large saving, both in manufacturing cost, and the type which should be used. Men engaged in this class of business do not view the matter simply from the standpoint of selling the most expensive type of bearing, but they are out to give real engineering service. It behooves designers therefore to co-operate wherever possible, and by so doing they will not only save money for the firm they work for, but add to their own knowledge at the same time.



Is It A Question Of Price?

CAN YOU imagine a manufacturer offering machine tools and internal combustion engines at bargain prices? Yet this is actually occurring at the present time. Several American technical publications are carrying advertisements which state that for a limited time. certain tools can be purchased for lower prices. One concern calls the venture a "no-profit" sale, and frankly admits that they are making this novel move in order to give employment to their machinists. The fact that the machines thus advertised are of high quality makes the movement all the more significant. If some mediocre type of machine were placed on the market at bargain prices, one would not be surprised, but to see tools of international reputation offered under such conditions causes one to look at the matter seriously.

We admire the aggressiveness of these firms, but feel that their effort to increase sales is being misdirected. Much better results would be obtained if they were to increase the efficiency of their selling staffs, rather than adopt a temporary reduction in price. Unconsciously, they are whittling for themselves a boomerang, for later on when things become stabilized, the confidence of their customers may be gone. A machine of good reputation does not need to offer bargain prices. Let such firms quote a fair price and stick to it. Shading of prices never helped anyone yet. For a while business may increase, but when conditions reach normal the cry is likely to go up that just because the market is firm, advantage is being taken of the buyer.

Without doubt, manufacturers should take advantage of the present lull, and go over their plant with the view of improving the present equipment, so that when things become normal again, and this condition is not so far off as some would have us believe, they would be ready to meet the situation. By all means let these manufacturers purchase their equipment at as good a price as they can, but it is doubtful if bargain prices will induce a man who has made up his mind that he does not desire further tools to buy.

A METHOD of preventing scale in boilers is recommended by a Russian engineer, and consists of adding a small quantity of linseed to the boiler water. The linseed is put in the upper part of a copper tank divided by a horizontal sieve of fine mesh and connected with the hot water supply. The resultant decoction, says "Practical Engineer," filters through the close meshed double copper sieve to the lower part, and is fed to the boiler through the injector. The slimy substance of the solution attacks every particle of the forming scale, which does not adhere to the walls of the boiler, and is readily ejected when the boiler is blown out. The necessary amount of linseed is stated to be about half a pound for every 100 horse-power. Taking 30 lb. of steam as corresponding to 1 horse-power, the quantity of linseed required would be about half a pound for every 270 gals. of feed water.

MARKET DEVELOPMENTS

Trading is Very Light on Market This Week

October Does Not Appear to Have Been As Good a Month As September—Reports from Various Markets, While Somewhat Conflicting In Character, Emphasize that Business is Quieter

THE REPORTS from the different markets are rather conflicting in character this week. Take for example, Toronto. The feeling in this district is that the past week has witnessed a considerable improvement. Expanded metal has advanced in price; sheets are expected to increase in price shortly, and machine tools are selling better than they were a week ago. Of course, business in these various lines is far from normal, but still considerable improvement since the first six months of the present year has occurred. Travellers say that they see a movement among manufacturers to roll up their sleeves and get ready for the real drive for business. This feeling is reflected in the percentage of enquiries which actually develop into orders.

In Montreal, however, they have a different tale to tell. Conditions are quieter in that district, and are not quite so good as they were during the month of September, or in the first half of October. Even in view of existing conditions, things are not nearly as quiet as they were during the first six months of 1921. Production in the various lines about equals the consumption. This in itself is a healthy condition from an economic standpoint. Second hand tools are in fairly good demand in this market, and in fact are moving much faster than new machines. The scrap metal is very dull, but this is general in all markets.

Pittsburg claims that what the steel industry needs for its business to get better is not for business in general to get better so much as to secure some extensive construction work where large quantities of steel are used. Pig iron production shows an increase for October, but after the middle of last month the general iron and steel market turned distinctly quieter. Producers fear that this will cause a softening in prices, and as the prices of steel products are already relatively low, it is felt that lower prices are not needed for the purpose of broadening demand.

The recent attempt to advance the price of sheets in the Pittsburg district has failed. The Toronto market talks this week about a possible advance in sheet prices, but it looks as if the Pittsburg failure will stop any such movement here.

Pig iron is extremely dull, and coke shows a tendency to soften. Bars, shapes and plates do not show any stability, with the result that the price varies considerably.

PIG IRON PRODUCTION SHOWS INCREASE; CONSTRUCTION WORK MUCH NEEDED

PITTSBURGH, November 10—Production of pig iron in October was at the rate of about 14,600,000 gross tons a year, or 22 per cent higher than in September. If steel ingot production increased in the same ratio it was at close to 40 per cent of capacity in October, against 32 per cent in September and 21 per cent in July.

Unfortunately the fact is not altogether as good as it looks. Increased production is excellent when it proves there is increased demand, but production without demand is not good. Of course there was demand in October, but in not a few quarters it is doubted whether the demand was sufficient to justify so large an increase in production over September. After the middle of October the general iron and steel market turned distinctly quieter, and producers fear that in consequence the softening in prices will be accentuated. As prices of steel products are already relatively low it does not seem that lower prices are needed for the purpose of broadening demand. Pig iron does not present altogether the same case, as pig iron is relatively higher than steel, by reason of the greatly increased freight rates having more effect on pig iron costs than on steel making costs.

General Situation

For many months the matter of demand upon the steel mills has been complicated, the relationship between steel demand and what is called "general business" being complicated. Ordinarily, steel activity is considered an index to general activity, and indeed the adage that "iron is the barometer of trade" goes farther than that, for it counts upon iron and steel activity coming somewhat before general business activity. There was a divergence between steel activity and general activity last July, of one sort, and now there is a divergence of another sort. Last July the case was that there were stocks of steel and manufactured wares that had to be liquidated, and the demand upon the steel mills was far below a relation to actual consumption. For a week or two the mills operated at less than 20 per cent of capacity, but the actual consumption of steel and steel products was not as low as that. As stocks were liquidated demand upon the mills increased, until in the fore part of October it was 35 to 40 per cent of mill capacity.

Now there is a divergence of a different sort to be noticed. The sum total of business or commercial activity in the United States is fairly large. Measured by the total amount of work done and the total volume of goods transferred it is not far from normal. One may ask how this can be the case when there is so much talk of "unemployment", but the explanation of that is that the number reported unemployed is really no large percentage of the population, while those who are in employment are working harder and more efficiently than in 1920, i.e., producing or handling more goods per hour they are paid for than a year ago.

The divergence is that the commercial activity is of such a character that it does not absorb its usual proportion of steel. There is very active work in building garages and dwelling houses, but that takes little steel. The same amount of money spent on power stations, factories and hotel and office skyscrapers

would mean much more steel. There is much activity in road-building, but that consumes very little steel. The same amount of money spent on railroad track, freight cars and locomotives would mean a great deal of steel.

What the steel industry needs for its business to get better is not for business in general to get better, but for it to run more to construction work and the various kinds of activity that involve steel consumption. Perhaps general business is not getting better. Perhaps it is getting worse, and quite possibly that will be a good thing for steel. The secretary of the treasury, who was Pittsburg's leading banker before he was called into President Harding's cabinet, is quoted in the daily press as saying he favors the secretary of war giving Pittsburg an extension of time in raising the bridges here, ruled by the previous war secretary to constitute an obstruction to navigation, on the basis that construction costs are likely to come down still more in the future.

Steel Prices

For a fortnight, the American Steel and Wire Company (Steel Corporation) has been soliciting its customers for contracts at present prices, as advanced September 12th, on the ground that prices are going to be advanced. The first report had it that nails were to go up 15 cents a keg, but it is understood now the contemplated advance is $2 a ton all around, which would make plain wire $2.70 and wire nails $3. Usually when a wire advance is undertaken the date for the advance is set. This time no date is named, the fact suggesting that it takes more time than usual to round up the contracts. The Youngstown Sheet & Tube Company, which did not make the September 12th advance at the time, announced its advance November 1st.

In sheets our report of a week ago noted that the $5 a ton advance attempted by independents had failed, the market being easier in tone instead of stronger. Now not a few independents are cutting the old price, commonly by $2 a ton, but there are cases in which a cut price of $5 a ton has been quoted, which means the old price, the minimum before the September advance. Regular prices, shaded in some cases as indicated, are $2.25 for blue annealed, $3.00 for black and $4.00 for galvanized.

On the afternoon of November 3rd, the American Sheet and Tin Plate Company announced a reduction in its tin plate price from $5.25 to $4.75. Independents had been doing $5.00 and less for some time past, and the remarkable thing is that the Steel Corporation did not act on this cutting several weeks ago, for the corporation's general policy for months past has been to meet competition when important.

In tubular goods the shading of the lists of September 16th is slightly more pronounced, but the amount of the shading is small, except in line pipe. Bars shapes and plates show approximately as much irregularity as formerly, which means that there is no set price. Each mill has various prices according to the nature of the inquiry and the circumstances and every order of importance is competed for separately. The general average in bars, shapes and plates is about $1.60.

POINTS IN WEEK'S MARKETING NOTES

Trade conditions during the past week have not been very encouraging. However, although trading is light, conditions are not so bad when compared with the first six months of 1921.

The recent rail orders secured in Canada are being rushed out, and in all probability will be completed before the end of the year.

Foundrymen are evidently looking for freight reductions in the near future, because they are asking to be protected against falling freight rates when enquiring regarding prices. This would tend to show that the material thus enquired after was for stock purposes only. Foundry stocks however, are as a general rule, very light.

Montreal reports that second hand tools are more in demand than new tools. Luckily the Toronto market has been selling more "new" tools than second hand machines lately. Machine tool manufacturers are getting their costs down, this being reflected in lower prices to the consumer.

Sheets are very brisk on the Toronto market, and an early advance in price is expected. Expanded metal went up 10 per cent. during the past week. No surprise is evidenced at this increase because it is claimed that production costs warranted the advance.

The scrap market remains very quiet in all quarters and is likely to remain so until foundries get more business.

Pittsburgh reports an increase in the production of pig iron. Construction work would help steel trade considerably. While there is a good amount of money being spent, the work being performed does not call for much steel work, hence the demand is light.

The market for sheets in Pittsburgh is easier in tone, the recent attempt at an increase in price having failed. This is the very opposite to conditions on the Toronto market. The fact that the advance did not materialize in Pittsburgh will perhaps mean no increase will be attempted here. However our Toronto letter mentions a possible advance as this is how things stand locally at present.

Pig Iron and Coke

The pig iron market has been extremely dull, and it looks as if consumers do not expect to need as much pig iron in the next couple months as was expected. That buying is being postponed on account of expected freight rate reductions is not altogether likely, since the buying has been of hand-to-mouth character in the past, and such buying could not well be postponed for such a problematical event as freight rate reductions. Prices are not quotably changed, but might be shaded if important inquiry arose. We still quote $20 for Bessemer, $19 for basic and $21 for foundry, f.o.b. valley furnaces, freight to Pittsburg being $1.96.

Connellsville coke is quotable a shade lower and is softer in general tone. We quote spot furnace at $3.25 to $3.35, contract furnace at $3.35 to $3.40 and spot foundry at $4.25 to $4.75.

SHEETS ARE BRISK CUTTERS DROP IN PRICE

TORONTO:—Nov. 10. There is a decided change for the better in the market this week. A few claim that the election is the only stumbling block to increased business, while others again state that the election has nothing whatever to do with the lull, and that from now on they expect things to develop steadily. One thing sure however, and that is, everybody feels optimistic as to the future. Take for example the steel market. During the past week, expended metal has gone up 10 per cent. in price, and warehouse prices generally have stiffened. All lines are fairly active, and sheets are decidedly brisk. One dealer said that about three quarters of his business during the past weeks was in sheets. The good weather is largely responsible for this activity, for it is giving builders a chance to work on the various structures which are now receiving the finishing touches. Speaking on the advance in price of expanded metal one dealer said that it was not surprising that this advance had taken place because for some time past, the existing price had hardly covered the cost of production. This same dealer said that he expects sheets to advance in price during the next few days.

Machine Tool Market

The general feeling in this market is that business is going to be much better. Dealers and machine tool salesmen say that they have noticed while on the road, that many manufacturers are getting ready for the come back of business. They are beginning to loosen up, with the result that more orders are coming in. The percentage

of enquiries and orders seems to be better balanced. For some time past, enquiries were frequent, but orders few. Now when an enquiry comes in dealers are beginning to have more faith in its possibilities. This increase in interest applies to the wood working trade as well as the metal working machines.

Small Tools

The small tool market goes on in steady fashion. The activity is good, and yet one cannot truthfully say that any improvement has taken place during the past week. It would seem as if this product has hit its proper stride, for the present at least, because the past three months has witnessed no change of any importance. Milling cutters have taken a drop, with the result that the 1½ increment has been taken off on high speed cutters, and standard list prices are again being quoted. On carbon steel cutters the reduction amounts to approximately 10 per cent.

The orders which keep coming in to this market clearly show that manufacturers are still adhering to their hand to mouth policy of buying. Dealers of course are not complaining, for the activity existent seems to be very general. "It goes to prove that when business really opens up we will be rushed with orders," said one dealer, and as he pointed out, the stocks of small tools throughout the country must be very low.

Scrap Metal Market

Things are still very quiet in the scrap market. One misses the old time hustle in this section, and it is very unliely that we shall see any improvement until plants generally commence to order castings. Instead of purchasing by car loads, the foundry owners are ordering only sufficient to cover the orders on their books. They refuse to stock up, for any scrap metal in the foundry yards is considered as so much dead money these days.

Everybody spoken to this week had their eye on the same period, namely, Spring. "Watch things pick up then," seemed to be the chief thought in the mind of dealers and manufacturers alike, and it is not expected that we will see any definite developments before that time. There may be an occasional spurt or two, but the real drive for business seems to be due about the turn of the new year.

TRADE CONDITIONS QUIET THIS WEEK NO CHANGE IN PRICES HAS OCCURRED

GENERAL trade conditions for the past week have not been very encouraging, although the amount of business moving is still a distinct improvement over that which averaged over the first six months of the calendar year. Still the trade cannot refrain from comparing the present volume with that of the somewhat better conditions existing during the month of September and the first half of October. Taking all matters into consideration, conditions are far from being in bad shape. After practically a year of quiet business conditions, the country has gradually liquidated its stocks of iron and steel and, it is the exception rather than the rule, to find the manufacturer or jobber with any large stock of materials, either raw or manufactured, on hand. Production in the various lines is about equal to the consumption, which is a rather healthy condition from an economic standpoint, although it works out as a hardship to many who must necessarily be among the unemployed. Some rumors have been present that there was a general shortage of galvanized sheets. This condition is not significant as stocks were short all along the line from mill to consumer and the seasonable autumn demand has been a heavy drain upon these small stocks. The condition will automatically adjust itself in a short time. The seasonable autumn demand has about spent itself. Building operations, generally speaking, are slowing down and everything points to a settling down for winter conditions.

Production of Steel

Production of steel continues to fluctuate between two limiting points, not far separated from one another. The total production and total consumption are, roughly speaking, about the same. Prices are not changing to any great extent. The present quotations leave only a small margin for the producer and are not likely to be cut to any extent. For some time past there has been a tendency toward stiffening in price, but practically no changes of any moment have been made. Present low prices have been made to stimulate business that might be slow in closing, and thus represent the point, beyond which the steel producer will not go, as it would be a losing proposition.

The recent rail orders are being rushed out and will be completed, in all probability, before the end of the year. Bars continue to be very quiet. Structural shapes are also rather quieter than they have been. Plates are only moving slowly. Sheets are moving in fair quantities. The week just past has not produced any individually large orders and the general volume of business is much the same as last week.

Pig Iron

The foundries have not come into the market for pig, to any great extent, this last week. Prices have not changed. If any increased demand for pig iron becomes evident the present limited supply will soon become exhausted and cause an increase in quotations. It is not likely that additional furnaces will "blow in" until there is more attraction in the margin of profit. This condition apparently was understood by the local foundries and the increase in business in September was, to a certain extent, speculative. To-day the small supply carried by foundries is considered ample. Of late the foundrymen making enquiries for quotations, which are made "f.o.b. furnaces, freight allowed to destination" seems to be of the opinion that freight rates are to be reduced, hence are asking to be protected against falling rates. This plainly shows that these inquiries are for stock and not likely to be used immediately. Some time ago several steel plants in the United States broke into the pig iron market and upset the prices. Following this the price was raised on two or three occasions to the present level and nothing further in this connection is expected as these furnaces have evidently disposed of their surplus pig at the low level and are not looking for further business in this line.

Machine Tools

Business is very quiet in new tools, but there continues a fairly large list of inquiries for second hand tools. Most shops throughout the country have not enough work to keep all their machine tools busy and thus are not in the market. Then again, the prices of machine tools appear rather high especially in view of the unsettled labor conditions which are reflected in the cost of all supplies and other materials, and tend to make machine shop profits uncertain. Thus there is presented a combination of circumstances that present a poor outlook for the sale of machine tools. In fact the country has a larger number of lathes, planers and general run of standard tools than would be required to take care of the needs even if times were normal. These tools will likely never be worn out, but will be discarded and replaced by more modern tools, highly developed, to continue the battle against high production costs. The machine tool manufacturers are getting their costs down, which is reflected in lower prices to the consumer. This together with advanced design and the addition of labor saving jigs and fixtures will create a little better volume of business, but it will take time to produce results. Meanwhile only an occasional sale of a new tool here and there, is reported.

Small Tools And Supplies

Small tools and supplies continue to move much the same as they have done for some time past. In fact, all things being considered, this department of the machine shop business is in a very satisfactory condition. It must be admitted that the volume is not large, but is satisfactory. Price lists have been established again and manufactures and jobbers are doing business along the old accepted lines. Prevailing prices are somewhat higher than pre-war levels due to the higher labor costs principally.

INDUSTRIAL NEWS

The Canadian Concrete Steel Co., Montreal, Que., has been incorporated with $200,000 capital stock.

T. A. Hollinrake, president of the A. R. Williams Machinery Co., was in Atlantic City last week on business.

Nineteen million feet of lumber was exported from the Province of New Brunswick in the month of September.

The Dryden Paper Company's plant recently resumed operation. They are now operating up to capacity.

The Molson Brewery, 906 Notre Dame St., E. Montreal, Que., is building a boiler house at an estimated cost of $80,000.

A. B. Salyerds of Preston, Ont., plans to rebuild his wood specialty plant which was recently destroyed by fire. The estimated cost is $50,000.

It is officially announced that the Peninsular Sugar Company recently organized with $2,000,000 capital stock will erect a sugar plant at Chatham, Ont.

Canadian Austin Machinery, Ltd., has been incorporated with a Dominion charter to manufacture excavating and cement-mixing equipment in Woodstock.

The Gurney Foundry Co., Toronto, Ont., took out a permit for alterations to their factory, 510 Queen St., W., totaling $18,000.

The Triumph Motor Equipment Co., has been incorporated with $250,000 capital stock to manufacture motor trucks, accessories, etc., at Hamilton, Ont.

Another new industry for Winnipeg, Manitoba, is the Home Appliance Co., who are to manufacture electric washing machines.

Spring & Auto Parts, Ltd., has been incorporated to manufacture springs, motors, engines, machines, carbureters, Automobile accessories, etc., with $50,000 capital stock in Toronto, Ont.

The Dominion Sheet Metal Corporation of Hamilton state that they are now filled up with orders for sheets which will run them until after Christmas.

Fire loses in Canada during the week ending October 19, are estimated by the Monetary Times at $509,750, compared with $184,900 the previous week.

The International Wheel and Rim Co., Ltd., intend to locate in Toronto and make that point their headquarters for their export business. This concern manufactures double disc steel wheels for automobiles.

The Hamilton Gas Mantle Co., Hamilton have added to their plant an up-to-date electro-plant for nickel, copper, silver, galvanizing, oxodizing and lacquering, having installed also a mechanical plating apparatus.

Some products, which in the past have been imported from France and the United States, namely french ivory and ebony articles are now being made at Port Elgin, Ontario, by the Stevens-Hepner, Ltd.

The Sommerset Tool Works have been established at St. John, N. B., to manufacture axes, hatchets, etc. It is their intention to make certain tools which have had to be imported from the United States heretofore.

The Alliance Brass Manufacturing Co., has been established at Peterborough, Ont. Machinery is being installed and production is expected to start about February 1922.

The Contract for the Electric Pumping Station to be erected at Point St. Charles, Montreal, has been awarded to the Atlas Construction Co., Limited, 37 Delmont St., Montreal.

The city of Verdun, Que., is having plans prepared for the installation of two electric pumps with 5,000,000 gallons capacity each to replace steam system.

The Anglo American Motors of Trenton, Ont., plan for a factory composed of 10 buildings, each to be an independent unit. The plant is to be equipped with modern machinery. The site at Trenton comprises 32 acres and they have been allowed a very favorable contract by the town council.

It is understood that the Fortes Vibration Company of St. Louis, Mo., are anxious to establish a factory for the manufacture of toys in Canada. From information received here, we understand that this firm wishes to locate near some suitable timber area.

The Prince Rupert Pulp & Paper Co., 602 Pacific Building, Vancouver, B. C., plans to construct the first unit of pulp mills at Prince Rupert, B. C., which will have a forty ton daily capacity. The estimated cost will be $1,000,000.

It has been decided to proceed at once with the erection of a new $500,000 home in connection with the Western University, London, Ont. It is also reported that the early construction of St. Peter's seminary is in view.

The Hull Electric Co., has ordered two One-man safety car bodies, 32 feet long over bumpers 8¼ ft. wide to replace single truck car bodies now in use. These have been secured from the Ottawa Car Mfg. Co.

Building records for the ten months ending October 31, in Sudbury were $426,910, an increase of $22,000 over the same period last year. The housing commission in that city are building very extensively.

The proposed new Imhoff Sewage disposal system for the city of Peterboro, Ont., will cost, it is estimated by city engineer Parsons, $320,100. This system will handle 6,000,000 gallons of sewage per day.

The Worcester Fire Extinguisher Co., Ltd., have opened Montreal offices at 137 McGill St., under the management of Mr. S. Skigmore. This firm will act as the sole Canadian Agent for the Rockwood Sprinkler Co., of Boston, Mass.

The McArthur Irwin Co., paint manufacturers of Montreal, report that although from 1914 to 1920 the production of all their lines was increased, their three factories have been kept working at full capacity for the whole of this year.

Another new industry for Chatham. Silverwoods, Limited, of London, Ontario will shortly commence in this city the erection of a building, the estimated cost of which is $75,000 for the manufacture of artificial ice and also ice cream for distribution within the province.

Mr. D. B. Hanna, president of the Canadian National Railways has stated that the net earnings for the month of September of one half million dollars is more than 10 times the net earnings of four different railroad companies amalgamated into the one under the former heading. 17,000 miles of railway are included.

J. Birchall, formerly superintendent of McKinnon Columbus Chain Co., and McKinnon Industries Limited has formed a company to be known as the United Chain and Manufacturing Co., with offices at 114 Queenston St., St. Catharines, Ont. The new company will manufacture tires, chains, automobile parts, accessories, etc.

INDUSTRIAL NEWS

According to reports, the erection of a paper mill near Fort George, B. C., to cost approximately $6,000,000, will be undertaken immediately, provided negotiations with the British Columbia Government for leases on timber limits are successful. Robert Tyhurst, of the Fraser Timber Syndicate, is responsible for this announcement.

A statement from New York says that if Ottawa should definitely sanction the manufacture of Oleomargarine in Canada for a period somewhat longer than one year, two or three of these manufacturers will consider building a Canadian plant. These manufacturers state that there is a very real demand in Canada for their product.

"I have a patent sash support, which I have sold in the United States recently for $25,000," writes a reader of Canadian Machinery, "and I am now desirous of getting in touch with someone who would be interested in the Canadian rights." Anyone interested in this can write to A. W. Nelson, Crouses City Hotel, Williamsport, Pa.

According to information received, nine French freighters are on their way to Canada to join the fleet of the Matthews Steamship Co., Toronto. About $2,500,000 is approximately the amount expended, the deal was closed by A. E. Matthews, the president of the above mentioned concern. Other vessels will probably be added to the Matthews Co., in the near future.

Brant Foundries, Ltd., have started operations in Brantford. This company was established to produce high-grade castings for plants in the Brantford district. They are now specializing in the production of light grey iron, brass and aluminum castings.

W. P. Kellatt, manager Dominion Steel Products, Brantford, is in England on industrial business. It is reported of this plant that demand for certain of its products has been very encouraging during the present season. Enquiries have been such as to necessitate overtime in the estimating department.

Hall Brothers farm machinery manufacturers state that during the first part of the year their business was not only up to that of 1920, but showed a 20 per cent. increase. A similar increase has been maintained during the latter months and looks fair to continue for the remainder of the year.

Heintzman & Co., piano manufacturers of Toronto show figures that, with one exception in which there was a small decrease, their sales for every month of this year are thousands of dollars ahead of the corresponding months of 1920, with October the biggest month of all.

Mr. George F. Porter, chief engineer of the Canadian Bridge Co., Walkerville, Ont., has had conferred on him by McGill University the honorary degree of Doctor of Law. Mr. Porter is very well known having been connected with the above concern since its organization. He was appointed by the Dominion Government to design the bridge across the St. Lawrence river near Quebec replacing the one which failed in 1907.

A Canadian chamber of commerce has been formed in London, England, with the object of promoting trade between the Dominion and the Mother country. The council is composed of representatives from each of the provinces in the Dominion together with representatives of various Canadian business interests. The acting Secretary is Mr. R. B. Stewart, in care of Beatty Bros., 55 Holborn Viaduct, E. C. I, London, England.

A Pamphlet received from the office of the Association of Railway executives, New York, states that several reductions in freight rates have been made. Following are those which interest our readers:—Iron ore 28 per cent reduction:—Sand, Gravel, pebbles, etc., 18 per cent; export iron and steel 25 per cent. In addition to the above, reductions have been made on iron and steel articles, pig iron, scrap iron and billets.

A Made-in-Galt exhibition will be held in that city Nov. 12 to 19. Considering the number of thriving industries in this Manchester of Canada, the displays should be interesting. In fact, it is stated that there are people in Galt who will be considerably surprised by the industrial importance of the city as indicated by the display. The people there have not been slow to encourage enterprise whenever it had worthy appeal, and the exhibition will go far to demonstrate that their confidence has been by no means misplaced.

Mr. G. A. Kingsford, who has been for 18 months a resident of Hong Kong, states that Southern China, which has a population of 80,000,000 people did an annual trade equal to between 1/3 and ½ as large as that of Canada. He pointed out that one of the greatest difficulties facing the Canadian business men in entering the Chinese market was the fact that Hong Kong was not represented by a Canadian Bank.

The Kerr File and Tool Co., Toronto, have reopened their factory which was closed for some time on account of the dearth of orders.

F. F. Barber of the Barber Machinery Company, was visiting several of their United States principals last week.

A fire broke out in the Public Utilities water pump house at Napanee, Ontario, November 3. The commission had just completed installing a complete new set of machinery, and workmen were in the building at the time.

Rae Machine Tool Company's plant at Hamilton, is being reopened for the manufacture of a complete line of vises and other metal working tools. Previously a line of machine tools was manufactured but for several months past the plant has been idle.

The Montreal Harbor Commissioners have installed another floating grain elevator making four now in operation in the port which greatly help in speeding up the loading of grain. The last elevator is working about 15 hours a day and hauling about 7,000 bushels per hour.

The Matthews Gravity Carrier Co., Port Hope, Ont., announce that they have added to their line a portable belt conveyor for handling bulk materials. The conveyor is made in two standard lengths, 17 ft. 6 ins. long with a 12-inch belt, and 20 ft. long with a 16-inch belt.

The Davis-Bournville Co., Jersey City, N. J., have published a pamphlet on "Tube welding machinery and fabricating equipment." This covers slitters, forming machines, welding machines, straighteners, seam grinders, swagers, cutting off machines, benders, and drawbench

The Port Hope Veneer factory has enjoyed a most successful season's business, and over 400,000 baskets have been disposed of. Arrangements are now being made providing for the manufacture of berry boxes and plant boxes in order to keep the plant running all winter.

The Little River Coal Mining Co., Ltd., capitalized at $2,500,000 has been organized, with head offices at Sydney, Nova Scotia, to develop and mine the coal areas at Codroy, on the west coast of Newfoundland, in St George's bay district. It is planned to start operation at once.

Mr. J. J. Wilson pioneer foundryman in automobile work has severed his connection with the General Motors Corporation and has taken charge of the foundry division of the Hiram Walker & Sons Metal Products Ltd., Walkerville, Ont. This company makes a general line of motor castings.

The Sumbling Machinery Company, Toronto, are working to capacity on their line of laundry machinery. During 1920 they sold more than in any previous year and this year is to date ahead of of the whole of 1920. In addition to domestic business they have received some large orders from abroad.

Edward D. Wilmer president of the Goodyear Tire and Rubber Co., states that notwithstanding the fact that sales during the first six months of 1920 have exceeded those of any period in the company's history, more tires have been sold during the ten months up to October 1st. 1921 than in the some period a year ago. In September the company sold 69,000 more tires than in September 1920.

J. J. Westway, representing James Handley Wright, has made application to the city of Calgary with the intention of establishing a tannery. At the present time Alberta hides are hauled long distances to Eastern Canada or the United States, and the leather sent back to Alberta. The establishment of a tannery in Calgary would eliminate the transportation charges and give the plant an advantage in the Western field.

INDUSTRIAL NEWS

The Canada Furniture Manufacturers, Ltd., have opened their second factory at Wingham, Ontario, and are working 9 hours a day with sufficient orders on hand to keep them busy for some time. Conditions in the furniture trade have steadily improved since July last, company reports, and business is on the upgrade though yet below normal.

The Goldstein Mfg. Co., Toronto. is erecting a new plant at Nos. 12 and 18 Beverley St. This will give them additional space and enable them to take care of the new business into which they have gone quite recently, which is the manufacture of copper and brass tubes, seamless drawn. They state that at present this is the only Canadian mill in operation turning out this product.

Chappells, Ltd., Sydney, Nova Scotia, have taken over the property and plant of Rhodes Curry Ltd. The property contains extensive sheds, warehouses and a large electric power wood working plant. They have added to their equipment automatic turning machines the chief purpose of which is to manufacture Bowling Alley Pins.

The Pullen Company of Toronto report a steady increase in sales of waste and wipers for August, September and October. Each month showed an increase over the preceding month while October sales reached the highest point of any month this year. As the product referred to is sold largely to industrial plants this item should be encouraging to Canadian Machinery readers.

The well known Toronto machine house, The Garlock-Walker Co., Ltd., made an assignment this week for the benefit of their creditors. It is understood that an immediate reorganization is under way and an important announcement regarding this future organization will be made within a short time.

If Customs returns can be considered as indicating trade conditions, business is improving with industries in Guelph, Ont., as collections for October amounted to $88,697.65 an increase as compared with the same in 1920 of $36,881,-94. Building operations for 1921 to date show a big increase over the corresponding 10 months of last year.

Col. The Hon. F. A. Dudley, president of the United Hotel Co., with F. W. Rockwell, and Gen. Leslie Kincaid, also of the headquarters New York office, were at the King Edward Hotel this week on an informal inspection of Canadian interests that within a year will represent investments roughly estimating $2,000,000 There are three hotels already erected in Ontario, which are controlled by these interests which will soon be added to by the Royal at Montreal and the Prince Edward at Windsor, Ontario. The building of the two latter is now being rushed with night and day forces working 8 hour shifts.

Mr. G. T. Milne, O. B. E., who will replace Capt. Evan J. Edwards as His Majesty's senior trade commissioner for Canada, Newfoundland and the West Indies, arrived in Montreal a few days ago, and has assumed his new duties at the Trade Commissioner's offices on St. James street. It is understood that in future the activities of the Trade Commissioner's office here will be curtailed, following the decisions of the authorities in England, but it is hoped by Mr. Milne that future work will meet with sufficient support from the Canadian business community to meet the needs of expanding business during the reconstruction period.

Leslie H. Hall, sales manager of the Williams Tool Corporation, Brantford, Ont., with head offices at Erie, Pa., says that their firm is doing much better business than a year ago. On being asked how he could account for this condition he said, "We knew our machines were selling at a fair price, so we decided that more aggressive methods of salesmanship were required. We have spent considerable money on educational and advertising literature, and our salesmen have been on to their jobs. The result is our business this last month is practically double the previous one."

A. S. Capwell, manager Canadian Buffalo Forge Co., Kitchener, has returned from a business trip to the Maritime Provinces. He states that he has seen periods of greater business activity than at present down by the sea, but reports some improvement in the demand for lumber. The New England States is the best and most convenient market for this and the movement noted will benefit lumbermen to a greater extent than by mere reduction of stocks. So much money is tied up in lumber that banks have been reticent about advancements for next season's operations. A more active market should relieve the money situation. Coming westward, Mr. Capwell noted that building operations became increasingly evident—an encouraging sign to one hopefully observant of any conditions making for improved business.

R. H. Cunningham & Co., electrical engineers, Walkerville, are completing for a textile concern, a heat-treating furnace which is somewhat unique. The purpose of the furnace is to treat large quantities of small metal rings of about one inch diameter, used for some purpose in textile manufacturing. At present an oil furnace is used for the purpose, the rings being carried on rods, a more or less laborious process. By the electrical method, one man shovels the rings into a hopper and the machine does the rest. From the hopper the rings are fed into a cylinder the length of the furnace, which is of circular shape.

A worm gear which carries the rings through the cylinder, is timed so that when they reach the point of discharge into a quenching bath, they have been properly treated. The machine is designed to be a labor, time and money saver.

Annoucement is made of the resignation of Mr. F. J. Bell as President and General Manager of the Canadian Wire & Cable Company, Toronto, manufacturers of electrical wires and cables, with factories at Leaside, Ontario, and branch offices in different cities of the Dominion from Halifax to Vancouver.

Mr. Bell has also resigned as President and General Manager of Leaside Engineering Co., which corporation controls the Cable Company and other firms, including Leaside Munitions Co., manufacturers of shells during the war for the British and American Governments.

Prior to joining the Cable Company in 1913 Mr. Bell was General Manager and Secretary of British Canadian Power Co., supplying electric power and compressed air to the silver mines of Cobalt and South Lorain in the Northern Ontario Mining District.

Lead base babbitt metal is the title of a publication which is being distributed by the Westinghouse Electric & Manufacturing Co., announcing the placing on the market of lead base babbitt metal. This metal is the result of many years' use of this material by Westinghouse, approximately 1,000,000 lbs. of lead base babbitt metal being used during 1920. The subjects discussed in this publication are overheating, bearing design, preliminary machining of shells, cleaning of shells, care of tinning alloy, tinning of bronze shells tinning of pipe and malleable iron bearing shells, anchor holes in case iron bearing shells, care of the babbitted metal cleaning solutions and materials This is known as Folder 4474.

Some of the hosiery mills in Ontario are unable to accept further business for this season's delivery. The sharp increase in business during the last six weeks has brought in as much as they are able to handle. The selling of goods is proceeding. One mill representative remarked that business was booked for the first half of next year. A similar report comes from Woodstock, Ont., where one knitting company that is working night and day reports having orders on hand that ensure capacity production until next May providing that a sufficient quantity of raw material is on hand. Three other knitting firms report good business in the same city. Here is still another similar report from Clinton, Ont. where it is stated that a knitting company which experienced a very decided falling off in its trade the early part of the year has resumed operations on a considerable scale, and has increased the number of employees steadily. Another manufacturing plant whose head office is in Clinton reports an increasing business from all parts of the Dominion with the plant running full capacity in all its four branches. A piano manufacturer in the same town finds that their plant is one of the first industries to get back to normal conditions. The fact

GEO MET RIC

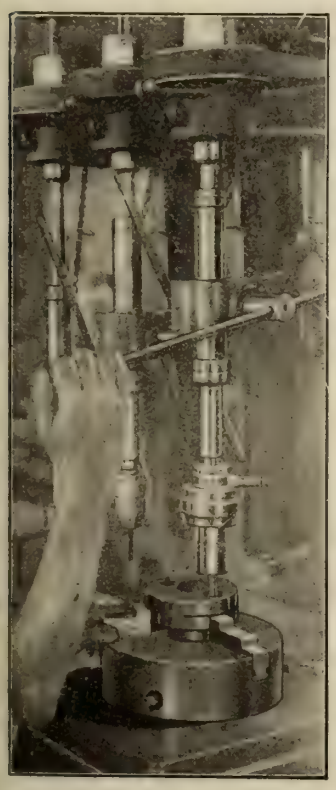
Right Rim the Lead

WHY BORROW TROUBLE?

If you have not reduced your tap breakage to the minimum, you are borrowing trouble.

Does it mean anything to you that there is a High Speed Tapping Device on the market which is

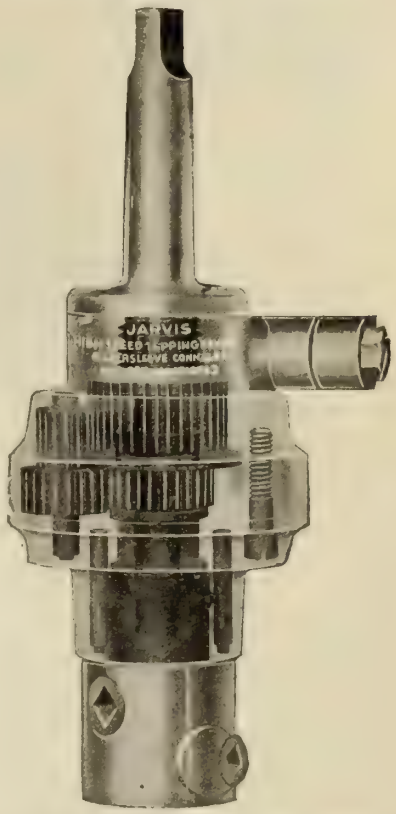
SUPERIOR



to any other known method.

Just get these few points now, and then send for the circular which will give you the rest of the story:

There is a Ball Drive and Ball Reverse. You can see how easy this makes the action, with no clinching or binding.



The Ball Drive gives direct drive from the spindle to the work. The gears operate only on the reverse.

Reverse motion is much faster than the drive.

Special Taps are not required.

It makes no difference whether the tap is forced against the work in a Drill Press, or the piece is pushed towards the tap in a Speed Lathe.

There are two styles of this Tapping Device. The Positive Style M and the Friction Style N. Where the tapping is in tool steel or any tough metal, or when a blind hole is tapped, the Cone Friction Chuck, Style N, is better.

Seven sizes of this Jarvis High Speed Tapping Device accommodate a range from zero up to 2 in.

And the PRICE—that, too, is reduced to the minimum.

One more important fact attaches to this Tapping Device. It is recommended and furnished by the Geometric Tool Company as a fitting adjunct to their line of Threading Tools.

THE GEOMETRIC TOOL COMPANY

NEW HAVEN CONNECTICUT

Canadian Agents

Williams & Wilson, Ltd., Montreal. The A. R. Williams Machinery Co., Ltd., Toronto, St. John, N. B., Halifax, N. S.

is now running with a full force and 12 hours a day turning out more pianos than at any time in its fifty years' experience in business.

Darling Bros. of Montreal report very good business for the year, largely owing to two or three contracts they have had, so much so that by the end of the year they expect to be very little behind last year's business.

Tenders for the extension of the Timiskaming and Northern Ontario Railway from Cochrane to Tin Can Falls, a distance of about 70 miles, will, it is expected, be called for some time during the first two weeks of next month, according to Lieutenant-Colonel L. T. Martin, of Ottawa and Renfrew, one of the commissioners of the railway, who has just returned to the city from Northern Ontario. Colonel Martin says that the extension will undoubtedly prove a success, due to the traffic that will follow the development. Everything he said, is being done to get contractors on the work as quickly as possible in order to relieve the unemployment situaton.

In order to assist desirable new industries without tieing up to much local capital, the Board of Commerce of Manistee, Michigan, is working out a new plan of co-operation with prospective industrial concerns. It is proposed to organize a local company to put up factory buildings in accordance with desired specifications and to sell those buildings at cost on a time payment plan and at a low rate of interest. The initial investment of an industry in buildings would be small and the industry could use practically all of its funds as working capital. It would not be the policy of the Board under this plan to encourage mere promotions, but sound, solid, substantial industries backed by men of experience and financial responsibility would be assisted.

The plant of the Hiram Walker & Sons, Metal Products, at Windsor, is being overhauled and somewhat reorganized. This concern is a large producer of special wires for electrical elements, and this particular department is being moved to a separate building.

Stimulus to all of the basic industries, and a marked feeling of optimism with new production and creative energy all along the line in the United States, is said to be the results of the recent advance in cotton prices due to low crop forecast. It is estimated that a continuation of the present improvement will bring the end of the period of depression about February and that by Spring a new and long-looked for normalcy will have become fairly well established. The National Automobile Chamber of Commerce notes the following indications of improvements: Larger output of iron, steel and coal; continued activity in textile and shoe industries heavy shipments of grain; gradual increase in railway earnings; increased activity in building construction; substantial gain in export trade, and continued increase in employment. Over the whole country the wholesale and jobbing trade has improved, and though the retail trade drags, it is not losing ground. Collections are reported to be slow in the South and East but better in the Middle West.

PERSONAL

On the first reading page of the present issue we have an article on "Ball and Roller Bearings" by O. H. Willison. A word about the author himself would not be amiss. Mr. Willison received his education in England, and later served his apprenticeship with the Lacey Hulbert Co., pneumatic and hydraulic engineers. From there he went to Peter Brotherhood, Peterboro, England, being engaged with this concern on some marine work of varied nature.

About 1911 he decided to come to Canada, and after arriving here, became connected with the machine tool department of the Canadian Fairbanks-Morse Co. Then came the war and Mr. Willison heard the call and answered it. After coming back from overseas he linked up his efforts with the S.K.F. Ball Bearing Co., later leaving them to join the staff of the Lyman Tube & Supply Co., Montreal, as bearings engineer, which position he still occupies. Mr. Willison knows whereof he speaks, and his article in the present issue should be read with interest.

Mr. E. A. Allcut, who is now associate professor in the department of thermodynamics, at the University of Toronto, is a man who should be well qualified for his new position. Professor Allcut graduated from Birmingham University with honors in chemical engineering. Later he took the M.Sc. degree, the Bowen Research Scholarship, and the Heslop Gold medal. He has done considerable research work on producer gas, and is a member of many engineering societies.

For 15 years he was engineering lecturer in the Smethwick Municipal Technical Institute and was also associated with the early experimental and testing work on the Humphrey internal combustion pump. Later on he was manager of the engineering and testing machine departments of W. & T. Avery, Ltd., of Birmingham. During the war Prof. Allcut designed a large number of special machines for testing materials used in the construction of aeroplanes, aeroplane engines, shells, etc. At the close of the war he became chief inspector of materials for the Austin Motor Company of Northfield, and was sent to France to reorganize the tractor plant of the company near Paris. On his return he set up in practice as a consulting engineer later coming to Toronto to occupy his new position.

STAINLESS IRON HAS WIDE USES

The advancement in the production methods and uses of stainless steel has been very rapid. The extent to which this style of steel has revolutionized the Sheffield cutlery trade is not so well known in this country as it might be. Stainless steel now shares honors with stainless iron, and as the London Times points out both these materials were discovered only eight years ago, yet the advancement in both products has been exceptionally rapid.

Stainless steel was the first to be manufactured, and soon afterward it was found that stainless iron could be produced by much the same process, with the exception that a smaller quantity of carbon-free ferro-chrome was required.

Stainless iron has been largely used for the production of golf clubs; it has attracted the attention of makers of stove grates and is being used for kitchen ranges, grates and fenders. An important and useful direction in which the material has been applied is in the fitting of motor cars; it is supplied in sheets for making hoods, and there is in contemplation its greater use for bodies and since it does not tarnish for replacing nickel-plated parts. It is made up into a wide variety of kitchen utensils and is used for shop signs and door plates. One British firm is producing the material in wire form, to be made up into door mats, and it is also being used for spring mattresses.

Another important development in contemplation is the use of stainless iron for the furnishing of railway carriages, engines and rolling stock generally. The proposal is that it should replace brass for door handles, brackets and many other fittings.

NEW TYPE OF VEHICLE

During the war the scarcity of rubber in Germany led to a feverish attempt to design vehicles which would give easy running in spite of being fitted with metal tires. None of the designs so produced appears to have been successful, and wagon constructors in that and other countries are tending to the exclusive use of solid rubber tires and even of giant pneumatic tires in order to reduce vibration and to prevent the goods carried in the wagon from being too severely shaken by irregularities in the road srrface. A British inventor has now made a vehicle which seems to have solved the problem. The body and frame of the new vehicle are carried on three vertical spiral springs, three to each axle, and each axle is anchored at both ends to brackets on the frames. The various parts are designed so that when wheels meet any road obstruction the axle can to some extent be displaced backwards as well as upwards. This horizontal movement is cleverly controlled by compensators which give considerable flexibility.

HEAT TREATMENT

(Continued from page 37)

For these reasons as well as others not mentioned, heat treaters have discarded oil for high speed steel to a large extent and have substituted various salt baths which have a relative low melting point and are soluble in water. This bath should be kept at a temperature of about 1100 to 1130 degrees Fahr. The merits of this method of quenching eliminate the danger of checking the steel as the change of temperature from the high temperature furnace to that of the bath is not as great as in the case of oil and the amount of contraction and strains set up in the steel is correspondingly less. The heat is conducted away from the tool more slowly in the salt bath than in oil, but fast enough to retain the hardenites in their proper form. As soon as the steel has acquired the temperature of the bath, it is removed and allowed to cool to some point below 650 degrees Fahr.

The tool is now hard but contains the strain set up in quenching and the full red hardness has not been brought out to the maximum. To get these results it is necessary to temper or draw the tool. This may be done in the same salt bath or one kept especially for the purpose. Experiments conducted to determine the proper drawing temperatures showed the following results as the temperature of the draw increased from 350 to around 700 degrees Fahr. the scleroscope showed a decrease in hardness. From this point up nearly 1200 degrees Fahr. the scleroscope showed an increase in hardness with the increase in temperature. Some metallurgists attribute this to the fact that is during this latter range of temperature that the red hardness of high speed steel is developed. While the scleroscope showed the steel to be harder at, say 1100 degrees Fahr. than at 700 degrees, a test made with a file show the tool to be softer. On actual cutting test the higher drawing temperatures always gave better results. This shows conclusively that neither scleroscope nor the file alone will give any indication of what a tool will do in actual cutting tests but if they are used together they will indicate to a large extent what may be expected of them. For general purpose a drawing temperature of 1130 degrees Fahr. is recommended, but if the operator is positive that his temperature recorders are correct, this drawing temperature may be carried up to 1175 degrees Fahr. Exceeding this temperature very much again causes the steel to become softer until the annealed condition is approached.

In conclusion it may be said that with care in handling and with a relable pyrometer equipment, anyone should be be able to heat high speed tools and obtain creditable results. The quenching and drawing in molten salts eliminate many of the dangers which formerly followed the old practice of using oil for these two operations. Lead baths have been used as a means of drawing, but on account of the lead adhering to the tool, particularly if there be scale on the steel, and the difficulty of its removal makes its value a doubtful one. Lead is also rather too good a conductor of heat to be the ideal bath for these operations. The exhausted cyanide bath will answer very nicely for both the quenching and drawing baths.

MONTREAL MARKETS

(Continued from page 45)

Practically no change in prices have occured during the past week in nonferrous metals. The small volume of business moving has continued throughout the week. Matters in New York and London markets are rather dull. It is difficult, jobbers staate, to predict the next move in prices, as no big business is in sight and it is reasonably safe to assume that no great activity will be evidenced for the next few days.

Classified Opportunities

BUSINESS CHANCES

WANTED—BY AN ESTABLISHED CONCERN. Twelve to fifteen thousand dollars for a period of from one to three years, to take care of business expansion. This concern will stand the fullest investigation. 8% is offered with ample security to principals only, with an opportunity of becoming permanent associates with the partners, if mutually satisfied. Box 767, Canadian Machinery. (etfm)

SALESMAN WANTED

ADVERTISER WOULD LIKE TO HEAR FROM a man who first of all is a real salesman; who has vision and a capacity for putting across big things. He should possess a knowledge of the Canadian trade, and of machine tools, and up-to-date engineering practice. State age, experience, and sufficient information to enable us to determine whether you are the man we want. The salary we are prepared to pay is big enough to attract a big man. If desired, information regarding identity of advertiser may be secured from Canadian Machinery before sending application. Apply Box 794N, Canadian Machinery.

HELP WANTED

WORKMAN FOR LOG BAND SAWS

Sheffield, England, steel mill wants good workman for Log Band Saws (all sizes). Must be capable of brazing, tensioning, and straightening. Give full particulars of experience in this work and where obtained. State wages expected. Box 796, Canadian Machinery. (c20m)

SITUATION WANTED

SITUATION WANTED AS SUPERINTENDENT or general foreman of machine shop, twenty years' experience. At present employed; best of references. Box 795 Canadian Machinery. (c23m)

PATTERNS

TORONTO PATTERN WORKS, 65 JARVIS Street, Toronto. Patterns in wood and metal for all kinds of machinery. (ctfm)

BRANTFORD PATTERN WORKS ARE PREpared to make up patterns of any kind—including marine works—to sketches, blue prints or sample castings. Prompt, efficient service. Bell 'Phone 631 · Machine 'Phone 733. Brantford Pattern Works, 49 George St., Brantford, Ont. (ctfm)

Machinery Wanted

Advertisements under this heading will be inserted once free of charge. Readers are invited to use this department when in need of equipment. Replies may be sent to box number, care of Canadian Machinery, if desired.

Grey Iron Castings

Light and Medium-Bench and Floor Repetition Castings; Capacity 15 tons per day.
Expert Metal and Wood Pattern Work. Our advice and estimates will save you money.
Semi-finishing operations on Lathe or Grill on Castings supplied if required.

ELK BRANDS FIRE BRICKS

A Brand for every purpose ensures the best results.

Each brand of Elk Fire Brick has some particular qualification which fits it to give better results in certain places than other brands we produce. It differs from the others either in grind, mixture of clays, or in method of manufacture, or possibly in chemical composition.

A trial will convince you that both our quality and service equal the best.

Large stocks of various shapes carried in warehouse in Hamilton.

Elk Fire Brick Company of Canada
Limited
Sun Life Building, HAMILTON, ONTARIO.

Would You Like to make some Extra Money?

Of course you would. Well then, why not do so? Canadian Machinery is always on the lookout for well-worth-while ideas, and are willing to pay a good price for them.

We are often asked, "What sort of ideas do you want?" Briefly, what we are desirous of obtaining is this, "Any idea that has proved of value in the machine shop, drafting room, or tool room." Think of how you got over some difficulty, a ticklish piece to hold in the lathe, or perhaps how you increased production on some particular piece. Any idea that saves time or money in the machine industry will appeal to us. Never mind the style. Write it as best you know how. We will put the finishing touches to both the wording and the sketch. Start in **NOW** and send us something of such a nature.

Address it to

The Editor, Canadian Machinery

DIRECTORY OF DEALERS

THE Buyers' Directory of CANADIAN MACHINERY was originally intended to contain information regarding lines actually manufactured by our advertisers. We now carry the advertising of leading machinery dealers, some of whom represent scores of manufacturers in addition to being manufacturers themselves in some cases. This necessarily widened the scope of our Directory, but it would be impracticable to list all the lines handled by all the dealers. We recommend, therefore, if our subscribers cannot find what they want in our Directory that they communicate with the dealers whose names appear herewith.

HEPBURN
POWER PRESSES

For Long Service--

After all, you could no doubt buy any number of presses that would give the same production the first few weeks of operation. But after a year—two years three years—What then? If it is a **Hepburn** built Press you get production unslackened by constructional weaknesses.

Hepburn Power Presses are strong and well built. The cranks are made from solid forgings and give long strokes. Quick adjustability a feature of every press. Write for specifications.
We also make Vertical Engines, Compressors, Winches, Planers, Steam Pumps, Cranes, Special Machinery Forgings and Castings.

JOHN T. HEPBURN Limited
Engineers and Iron Founders

18-60 VAN-HORNE STREET, TORONTO, ONT.

Buying a Pig in a Poke

The buying of advertising space used to be buying "a pig in a poke." The quantity and quality of circulation was shrouded in mystery and often the bag was tied against investigation.

That day has passed. The advertiser no longer depends upon "mere claims." The Audit Bureau of Circulations has untied the strings to the sack and the circulation of the better class of publications is thrown open for the most searching scrutiny.

In buying advertising space in the Canadian Machinery you are not buying "a pig in a poke." Our A. B. C. statements will stand the analysis of the most exacting investigator.

For heavy work—

BROWN & SHARPE
No. 6 Automatic Screw Machine

With the characteristic high production, accuracy, and economy of operation of the smaller Brown & Sharpe Automatics.

See Page 31

You Need a Good Die Stock Set

If you need one at all.

Because a **GOOD** Die Stock Set embodies:

1. Accuracy in its product.
2. Adjustment for wear.
3. Free cutting qualities.
4. Provision for sharpening.
5. Ample adjustment for oversize or undersize.

P. & W. Die Stock Dies **ARE GOOD DIES.**

BETTER than most because of the interchangeable feature in their chasers. A broken chaser in a P. & W. Die doesn't mean a new set of chasers. You can get a new chaser to replace a breakage and the new one "fits in" perfectly in your old set. That's the 6th point, **"ECONOMY IN OPERATION."**

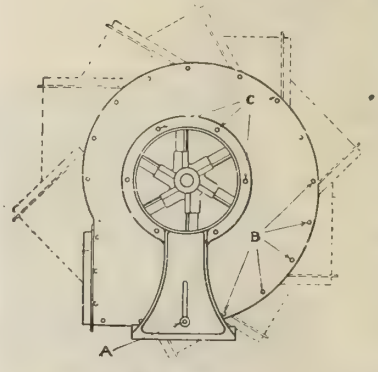
Worm Gears

Let us help you to select sound designs for your gear drives.

Hamilton Gear & Machine Co.

Van Horne St. Toronto

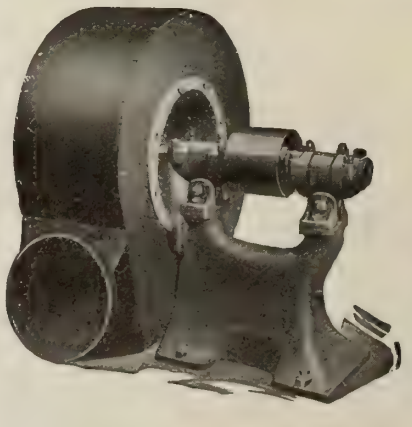
Canadian



The Canadian Standard Reversible Mill Exhauster will keep your shop clean, remove sawdust, shavings, fumes, gas or any loose materials and disagreeable odors.

Insurance rates can be reduced; floors and machines covered with sawdust, chips or shavings, increase the fire risk.

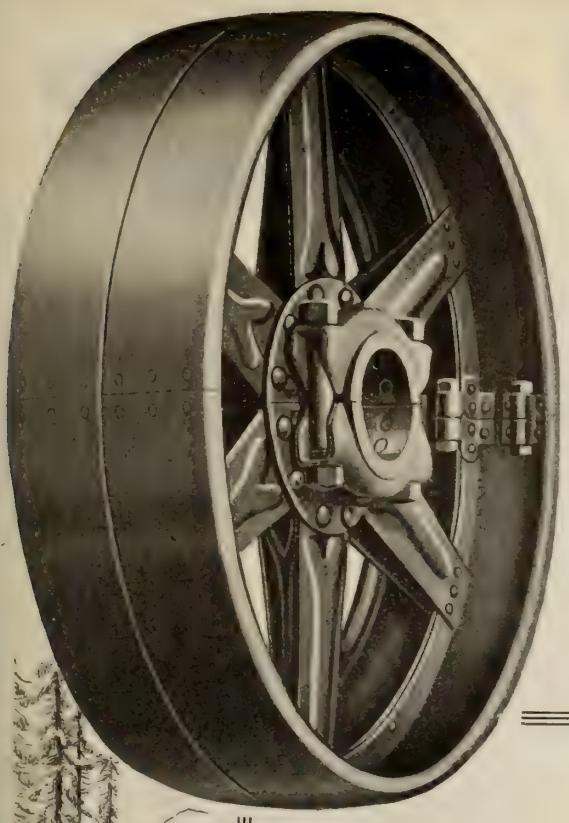
Insurance companies reduce the premiums where adequate precautions have been taken to prevent fires.



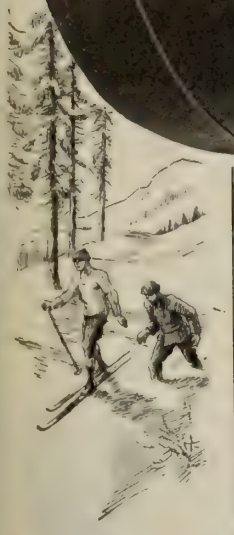
Blast Wheel — This wheel is so constructed that it will handle any kind of stringy material efficiently, such as sawdust, shavings, cotton lint. Will also handle gases, fumes, smoke, etc.

The Canadian Standard Planing Mill Exhausters have reversible housings so that the outlet can be adjusted instantly to any angle desired.

This eliminates necessity of crossed belts. Simplifies changes on alterations in piping or building.



The housing is of heavy rolled steel plate securely bolted together with angle irons, round cast iron outlet bolted to the housing. Blast wheel mounted on heavy cast iron spider.



Every fan carefully tested by running test at speeds in excess of that required.

Write for Catalog No. 16.

Canadian Blower & Forge Co.

Kitchener - Ontario.

Where Resistance is Lowered More Power is Delivered

Just as skis aid the traveller by reducing resistance and lost motion, so "American" Pulleys transmit more power by reducing bearing friction, belt slip and weight on shafting.

How this is done is explained in detail in our book, "Getting Maximum Pulley Efficiency" Yours for the asking.

The American Pulley Co.
Philadelphia, Pa.

The AMERICAN PULLEY

You pay your workmen well for their time and effort: don't waste this labor-element by keeping dull files in use.

A file ceases to be fully efficient as soon as it has begun to lose its keen-cutting edge. Replacing it costs only a trifle but means much in increased efficiency.

These brands, the standard for over fifty years, do not dull quickly:–

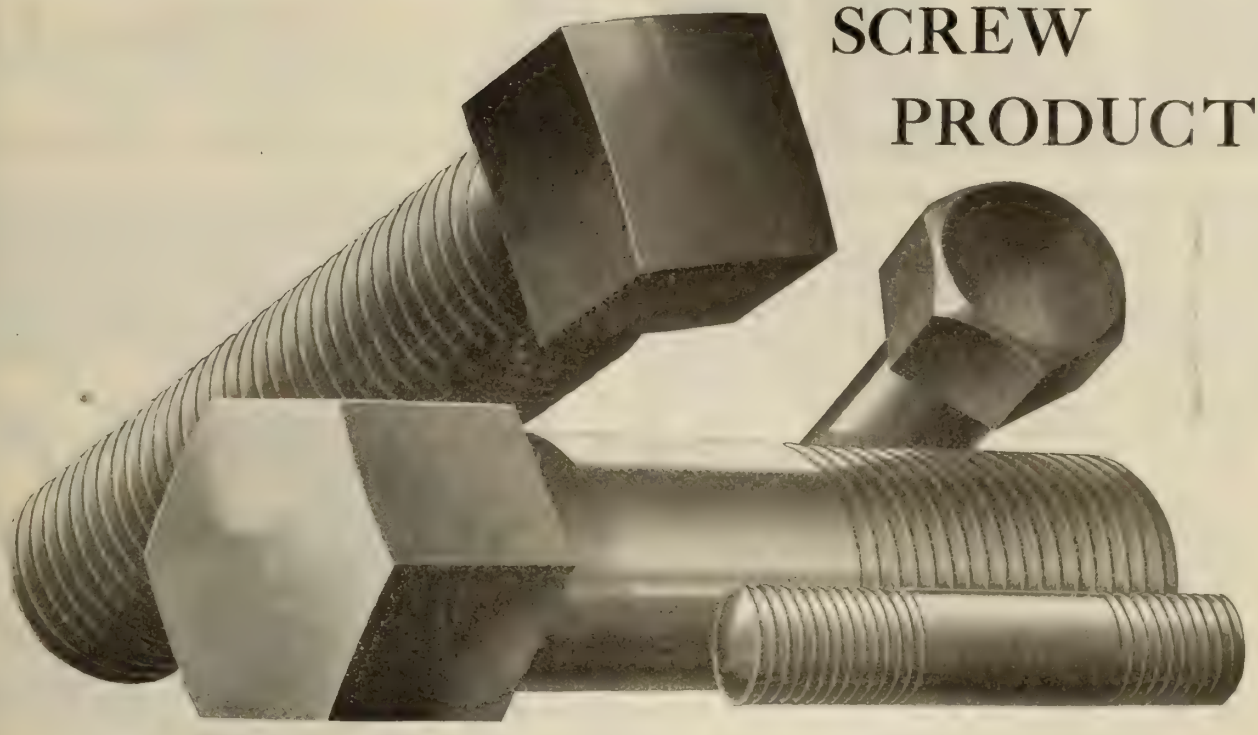
SKF

SELF-ALIGNING

BALL BEARINGS

WHEN bearing troubles crop up in your plant it is well to remember that problems just as difficult have been solved by SKF Engineers. It may have been in England, France, Japan or United States—but the knowledge and experience that solved them are at YOUR Service here in Canada—free of cost or obligation.



Consult SKF Engineers—they can end your bearing troubles.

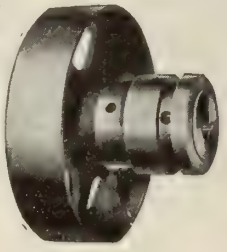
80 H.P. Morse Drive to Rolls, reverses direction every 45 seconds

THE JOHNSON FRICTION CLUTCH



It's a Johnson Lineshaft Drive

A battery of twelve light presses, all on a bench about 30 x 5, driven from one lineshaft with Johnson Clutches controlling the machines.

Illustration by courtesy of The New Departure Manufacturing Co., showing bench presses in operation at their Elmwood Plant.

FRICTION CONTROL MEANS BETTER MACHINERY

We specialize in applying the proper type of friction clutch on any sort of an installation. Standard clutches available from stock, and special models developed to suit conditions.

COMPARE IT FOR FIRST COST

Twelve Clutches against twelve complete counter shafts, or twelve individual motors.

COMPARE IT FOR EFFICIENCY.

Quick, smooth control against the sluggish tight and loose pulley. Or one motor consuming current instead of twelve.

COMPARE IT FOR SERVICE.

You know the failing of belts—the continual attention they require, especially when they are shifted. If you don't know Johnson Clutch Service, just give it a trial.

Write for our booklet

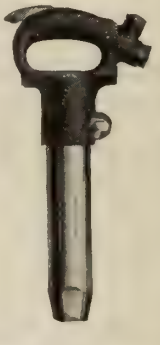
Cleveland Sand Rammers

FOR FLOOR, BENCH, PEIN AND FLASK RAMMING

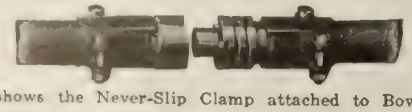
Cleveland Sand Rammers are made in several sizes and weights, and are adapted for all kinds of Foundry Ramming.



The Piston Rods are packed with a resilient packing which prevents any dirt from entering piston chamber and working parts—They are fitted with either Round or Flat Rod as required. Cleveland Rammers are light in weight, have high speed and practically no vibration, making them ideal foundry tools.

CLEVELAND CHIPPING HAMMERS

For Foundry Work. Are furnished in any required size or weight for grey iron or steel castings; they have high speed, and are adapted for fast chipping now required by piece-workers.



CLECO PRESSURE-SEATED AIR VALVES AND BOWES AIR HOSE COUPLINGS

Are Standard Equipment Everywhere

Both Valves and Couplings are pressure tight.

Bowes Couplings are instantly connected or disconnected.

Bowes Couplings are absolutely air tight under all pressures.

Above cut shows the Never-Slip Clamp attached to Bowes Coupling.

IN STOCK:—RIVETING HAMMERS, DRILLS, REAMING, TAPPING AND FLUE-ROLLING MACHINES, CORNER DRILLS, PORTABLE AND BENCH GRINDERS, PRESSURE-SEATED AIR VALVES, ETC.

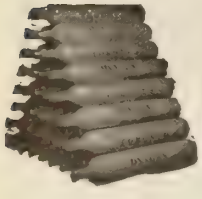
Engineers and Manufacturers BRANTFORD, Canada

Dies and Special Machinery

One of a Set of Dies for Blanking Automobile Fenders

The smallest Dies in use to huge fixtures weighing as much as 8 tons are produced in our plant. We make Dies--and Special Machines as well—for practically all the Automobile manufacturers in Canada; for Canneries, Pulp Mills, Rubber Tire Factories, Sheet Metal Plants, Electrical Equipment Manufacturers and others. If you require this class of work why not talk it over with our engineers?



for every purpose —large or small— intricate or simple— are exactingly designed by

FORD-SMITH

Some say it is the fine quality of material used that accounts for the long life of our Dies and Special Machines. Others will tell you that the accurate following of specifications and close attention to details have a lot to do with it. But we believe it is a combination of both made possible by a complete tool plant and an expert engineering staff.

THE FORD-SMITH MACHINE COMPANY, LIMITED

HAMILTON - - CANADA

OXYGEN AND HYDROGEN

(ELECTROLYTIC)

National Electro Products Limited is the largest manufacturer of Electrolytic (pure) Oxygen and Hydrogen in Canada.

WE PRODUCE GASES EXCLUSIVELY BY ELECTROLYTIC DECOMPOSITION OF WATER

We are, therefore, in a position to furnish Oxygen and Hydrogen far superior to like gases made by any other process.

After Exhaustive Tests We Have Decided to Handle The Well-Known

The Torch for Welders OXYGEN PUROX HYDROGEN Who Want the Best!

WELDING AND CUTTING TORCHES

Our entire organization—technical and sales—is always at your service.

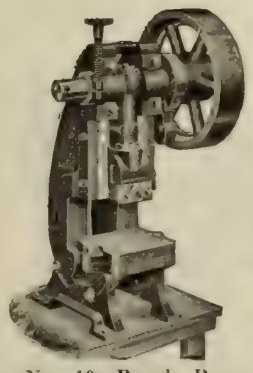
When You Need

DIES--JIGS--FIXTURES



Special Machinery—

No. 140—Double Crank Trimming Press

have them made by men who have made a life study of the metal-stamping business. For years the "B-B" shops have been supplying the Canadian trade with Stamping Presses requiring **maximum service** dies. Long experience has assimilated the knowledge of building dies that really produce with "fewer operations."

Send us samples or drawings and we will quote you and guarantee satisfaction

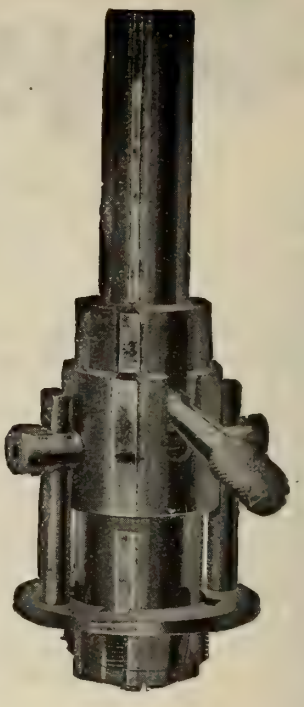
No. 10—Bench Press

"B-B" Power Presses

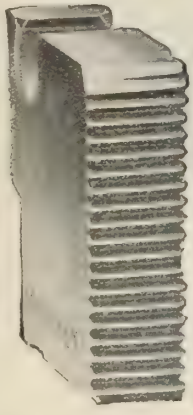
Amply powerful machines with a reputation for sturdy dependability. Made in many different types for blanking, forming, punching, trimming, etc. Ask for a copy of our catalogue.

A business with us— Not a side-line

Our long experience covers dies of every description for pieced tinware, electrical fixtures, steel ranges, paint cans, all kinds of automobile stampings, mechanical toys, etc., etc. This experience is at your command and prevents much unnecessary and expensive experimenting, which most shops are up against and must include in their costs.



THE BROWN-BOGGS CO. LIMITED



HAMILTON, CANADA.

Talk About Saving Time and Labor—

Murchey Collapsing Taps and Self-Opening Dies

will boost your production fifty per cent. and at the same time turn out better and more economical work than ordinary tools.

Murchey Tools are built for long, hard service. The fine materials and workmanship, their extremely simple design and rugged construction, enable clean, accurate threading under all conditions.

If you would experience a new kind of tap and die satisfaction send for a trial order of Murchey Taps and Dies.

Murchey Machine & Tool Company

75 Porter Street, Detroit, Mich.

Coats Machine Tool Co., London, Glasgow, Newcastle, Eng.
Fenwick Freres & Co., Paris, France

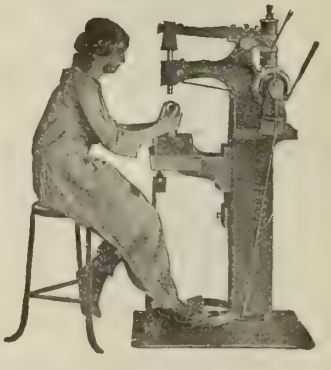
Buried in the Work and Broke!

Next time a tap breaks below the surface of a large casting, don't let some makeshift method of removing it injure the thread and waste half an hour of valuable production time. Instead—

Walton it Out in a Jiffy

And save the casting.

Special analysis steel fingers of the Walton Extractor drop into the flutes of the broken tap—and grip. Then a few turns of a wrench applied to the squared end of the Extractor backs out the buried tap.



Sixty-day trial offer proves the Walton Extractor pays for itself.

Write.

The Walton Co.

Hartford, **Conn.**

The Hammer With The Human Stroke

HEADS RIVETS COLD

Heads 'em tight or loose, flush, countersunk, or finishes heads any shape desired, and at the rate of:—
A rivet a second, sizes up to 3/16".
A rivet in two seconds, size ¼" to ⅜".
A rivet in three seconds, size 7/16" to ⅝".
And on special order we build machines to handle rivets up to 1½" with proportionate rapidity.
Built in eight sizes.
Besides riveting, the High Speed Riveting Hammer does all kinds of peining, swaging, upsetting, etc.
Send us sample assembly parts with rivets or sketch of your work,
and
Let us shoulder your riveting problems.
Send for the High Speed Hammer Book.

THE HIGH SPEED HAMMER COMPANY, INC.
ROCHESTER, N.Y.

The Ambulance of Industry

THE oxy-acetylene welder's hand truck is the ambulance of the modern machine shop.

Instantly accessible, quickly and easily wheeled to any part of the shop, wherever the job may be—the oxy-acetylene outfit saves thousands of dollars by eliminating delay and reclaiming broken parts.

Prest-O-Lite Dissolved Acetylene has made possible the use of a highly pure gas in an easily portable and economical form.

A chain of plants and warehouses *insures* a never-failing and prompt supply of this most useful of gases in any quantity anywhere.

DOMINION ENGINEERING

HEAVY FOUNDRY AND MACHINE SHOP SERVICE FOR MACHINE BUILDERS.

We have Foundry and Machine Shop Equipment for handling Grey Iron or Semi-Steel Castings up to 75 tons in weight, and invite inquiries from builders of heavy machinery who may require castings of unusual size.

Our facilities enable us to handle work up to 35 ft. diameter. All castings will be found uniform in quality, easy to machine and of suitable mixture for your purpose.

We shall be glad to figure on your requirements on receipt of blueprints and specifications.

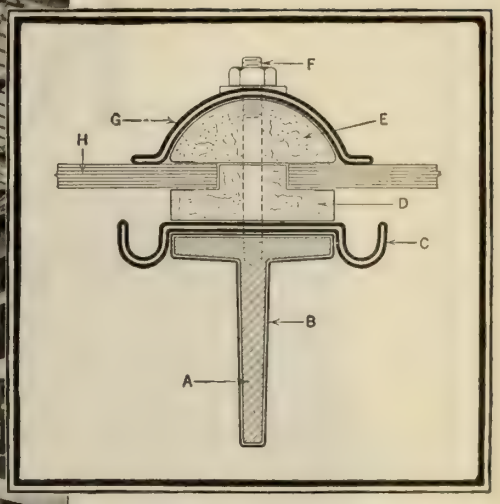
Dominion Engineering Works, Limited

Montreal, Canada

"Hisco" Machine—Molded Gears

The fact that "Hisco" Machine Molded Gears require no pattern is a factor of considerable importance when the price of lumber and labor is so high. "Hisco" quality insures accurate, dependable gears. Remember — **the price of "Hisco" gears does not include the cost of patterns.**

We are also manufacturers of Steel, Chrome, Manganese and Nickel Steel Castings, Annealed and Unannealed; Cement Mill, and Mining Machinery; Castings; Stamp Mills; Crushing Plants; Excavating Outfits; Steel Car Wheels; Locomotive Driving Wheels and Frames, etc.



Let us know your requirements—we do the rest.

Hull Iron & Steel Foundries, Limited

HULL, Quebec

One of the four large courts in the Cadillac plant. These courts and a large loading platform are covered with Robertson Process Skylights. 106,710 sq. ft. were used.

Study this Cross Section

Shows the important details of Robertson Skylight Construction.

A—Standard Rolled Steel Tee, Angle of Channel Bar-Beam. B—Robertson Process Protective Coating. C—Robertson Process Metal Condensation Gutter. D—Asphaltic Glass-Cushion and Separator. E—Asphaltic Cap-Filler. F—Cap Bolt and Nut. G—Robertson Process Metal Cap. H—Glass.

"This Factory Must be the Last Word"

Such was the aim of the Cadillac organization when plans were laid for the building of its new plant in Detroit. Everything that engineering skill and competent workmen could do to *realize* this ambition has been done. Plans, materials and equipment *of the best* have been here assembled, and the result is a noteworthy example of plant efficiency.

That Robertson Skylights were chosen for this vast undertaking is significant. To pass the rigid tests and meet the requirements of Cadillac engineers is assurance of "more than ordinary" ability. Robertson Skylights "made good" in the tests and are now proving their worth in actual use.

106,710 sq. ft. were used in the new Cadillac plant. Seven large skylight courts are lighted and protected by this Robertson Product. Two large loading marquise contain nearly 10,000 sq. ft.

Correct design and *enduring materials* are the two important elements which give Robertson Skylights their exceptional advantages. The Robertson design meets all demands of the architect and engineer. It proves a supporting bar capable of carrying its load without deflection. It provides a perfect asphaltic bed for the glass—two elements that eliminate glass breakage and prolong the skylight life. Furthermore the Robertson design is equipped with efficient condensation gutters. It meets every requirement of endurance and appearance.

Enduring materials is the most important asset of Robertson Process Skylights—*All Metal parts are made of Robertson Process Metal and are fully protected against rust and corrosion*. Complete information, including architectural details, will be sent upon request.

Our engineers have issued a number of technical bulletins covering Robertson Process Metal and Robertson Process Gypsum (both reinforced gypsum slab and poured in place roof construction), as well as the Robertson Skylight Construction.

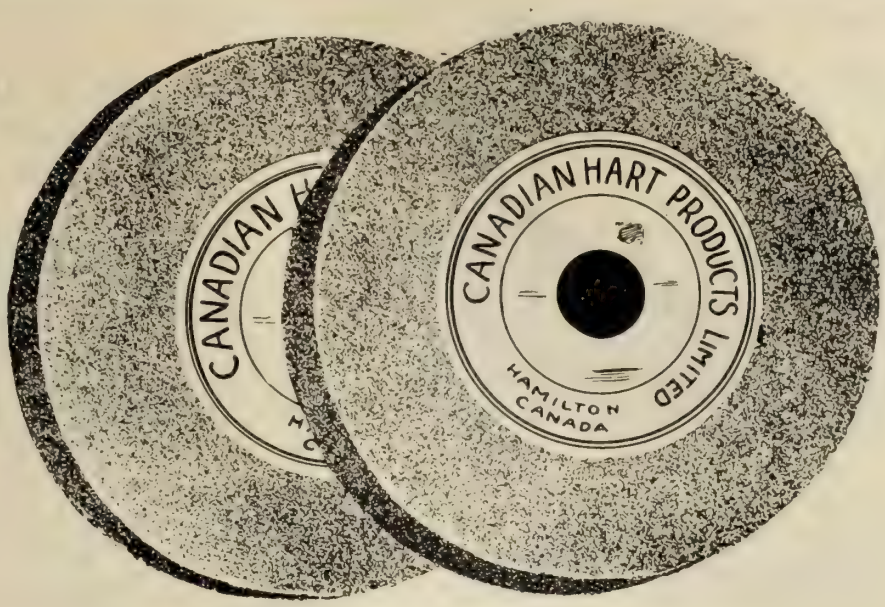
Dodge is selling in Canada

To no small degree the revival of business in Canada is discernible in the ever-increasing flow of orders to the Dodge plant. The real business men of Canada are going ahead; they are living the policy that in order to sell they must buy. They are buying carefully but they are buying consistently.

Those who are wise enough today to drop standstill methods and by going ahead are causing others to follow, are those who at all times seek the best in factory equipment. They are guided by a true understanding of value as compared to cost, and are buying Dodge power transmission machinery now on a basis of quality, reliability and service in the face of greatly reduced prices on cheap lines.



To those who are just coming back into their own, Dodge offers its every facility. Immediate delivery is possible on Dodge Standard Wood Split Pulleys, Dodge Standard Iron Split Pulleys, Dodge Steel Split Pulleys, Dodge 4-Point and Ball and Socket Hangers and all other products made by Dodge in Canada. You cannot better place your business and your confidence than with Dodge.

Canadian Hart Products

Grinding Wheels That Cut Faster And Last Longer

Many of the largest shops in the country use Canadian Hart Wheels exclusively. We know the class of work these shops do and we take particular care to supply wheels of the proper grain and grade — they cut faster and last longer.

Just a line or two from you acquainting us with the nature of the work you wish to grind and we will select the "Canadian Hart" best suited for the purpose. There is satisfaction and profit in having us choose the right grinding wheels.

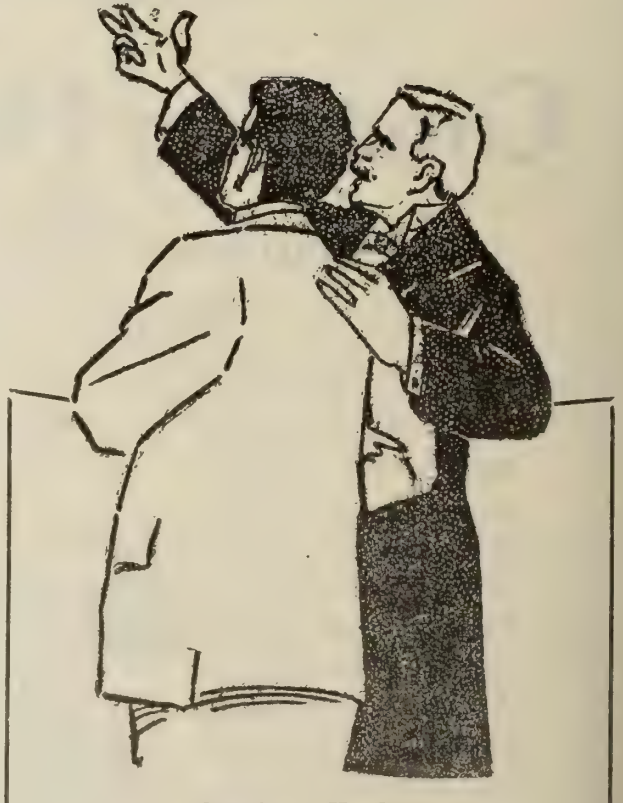
"For Twenty Years my Advisory Board"



The president of a large industrial concern was speaking (if we told you the name of the firm you would immediately recognize it as one of the foremost of its kind in Canada).

"I do not wish to take more credit than is my due. For the past twenty years I have had a very able Advisory Board. Throughout all this time, H. W. Petrie Limited have been unsparing in the time they devoted to helping me install the right kind of equipment.

"Never have I been misled about a piece of equipment—but always received the most authoritative advice. I tell you it's been a profitable pleasure to do business with them."

Whatever it is, as long as it is machinery, we have it. Rush orders promptly filled from stocks on hand. Our long experience can benefit you. Why not write to-day for information?

Why This Booklet Can Help You---

IT is a carefully prepared study and analysis of the best information available on *Modern Cutting and Grinding Methods*, compiled from many years of experience on all sorts of work. It deals with practical methods of applying scientific knowledge of the subject to every-day shop problems.

Many useful shop tables of grinding and cutting speeds, standard measurements, etc., make the booklet worth keeping for reference purposes. There is much practical information on many points that can be of use to you:—*knowledge that has increased production and reduced cost for others.* Have you answered these questions to your entire satisfaction in your own shop practice—

How and under what circumstances can a water compound be used to advantage?

How to reduce "loading," cut down the number of dressings, and lengthen the life of the wheel?

Why is it important to make the compound fit the work?

How to prevent rust?

How to keep the work and the machine clean?

As one expression of what we mean by Oakite Service, we shall be glad to send you a copy of this booklet free. Write us today.

He's Got Facts

Armed with the Starrett Book for Machinists' Apprentices, the beginner isn't afraid to discuss the most important tool facts with his advanced fellow-worker. It is as valuable to the apprentice as many months' extra experience.

A mass of information in this little volume. Only by an immense amount of digging into books and articles could as many useful facts be secured. How to lay out work, how to read drawings, micrometers, limits of tolerance; how to measure screw threads and lathe work—the answers to all these questions, and many more of similar nature, may be quickly found in this handy little book.

75 cents at any Starrett Dealer Store, or direct in receipt of price. The new Starrett Catalog No. 22 "3" will be sent free to any address on request.

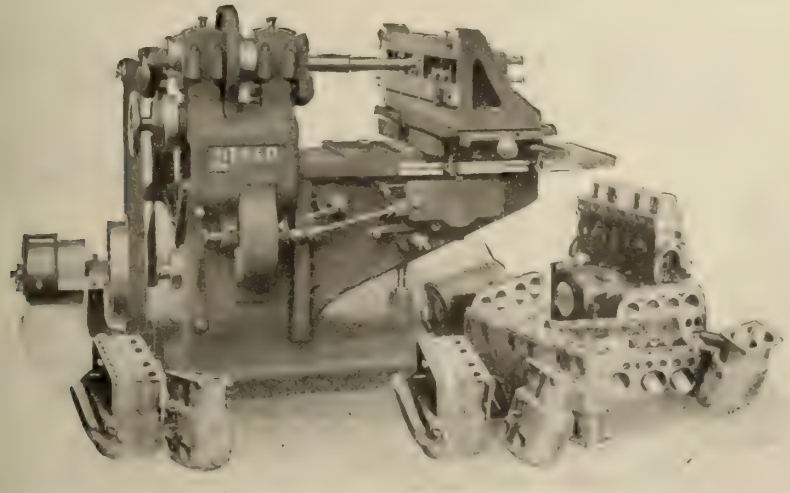
You Can't Get Away From Regrinding Possibilities



Location has nothing to do with cylinder regrinding possibilities. Motor driven vehicles are like the poor—you will find them everywhere, whether in the frozen North or in the torrid tropics.

There are over 400,000 registered cars in Canada and only 12 Heald-equipped shops to handle these possibilities, and remember—it only takes 3 four en bloc cylinders a day to make handsome profits on the investment required in a two-man shop.

There is not a single mechanical field in this Dominion today that has the chances that regrinding has. It is spreading like wild-fire in the States and still the demand is greater than the production. Once the motor owners are educated to its values, there will be a scramble to see who will get the trade, and if you want to be the lucky one, investigate the proposition today.

Remember one thing—that the heart of the regrinding shop is the grinding machine and that, while the possibilities are everywhere, there is but one grinder that is tried and true. For 16 years The Heald Machine Company has been building machines devoted exclusively to this class of work. They are used by every automobile manufacturer that grinds his cylinders. You can't go wrong when you purchase a Heald.

We have a booklet that goes into the details very minutely on the possibilities, profits and equipment required. We would be very glad to send this to any address.

"Canada's Next Premier"

No matter which he is—all three possibilities are pen-pictured in

November 15 MacLean's

"Scrutator," a writer of rare analytical power, holds the mirror up to Meighen, King and Crerar. Each of the three is "called up" in printers' ink as true to life as if they stood there separate and distinct in flesh and blood. It is one of the most searching, masterly articles ever written with public men as subjects. It is fair to each—and nothing more; a cold-blooded analysis of the virtues and weaknesses of the candidates in turn. It will surprise you, startle you, tantalize you with its subtleness and depth.

"Funny Thing That Tariff"—by J. K. Munro. This number of MACLEAN'S has four timely articles dealing with Big Politics, the whimsical observations of J. K. Munro are, as usual, full of amusement as well as information. Munro just can't help seeing the funny side of politicians and politics. Of Ottawa and Parliament Hill he makes a sort of continuous vaudeville performance. He gets some big laughs out of election activities.

Lt. Colonel John Bayne MacLean

has been a watcher from the hilltops longer than most of the present-day school of Canadian writing men. As usual, in his article on the Dominion political situation in November 15th, issue of MACLEAN'S MAGAZINE, he strictly maintains the detached attitude of the true journalist. But in his survey of the field and the political gladiators there is a warmth and an intimacy with both the men and the situations that could be imparted only by one who has long been a close and observant student of governments both Dominion and Imperial. This article appears under the caption—

"All Three Are Good Men."

"Our Election Enigma—Women!"—by Agnes C. Laut. How are they going to vote? Are they going to vote at all? Are they going to realize citizenship? These are some of the potent questions asked and answered by one of Canada's leading women authors—Agnes C. Laut. What influence will woman with her vote bear on Canadian politics? Will the woman wage-earner join the ranks of labor when it comes to the battle of the ballots? There is a fund of information for both men and women readers in this right-on-the-minute summary of Miss Laut's.

Other Gripping Features in This Issue:

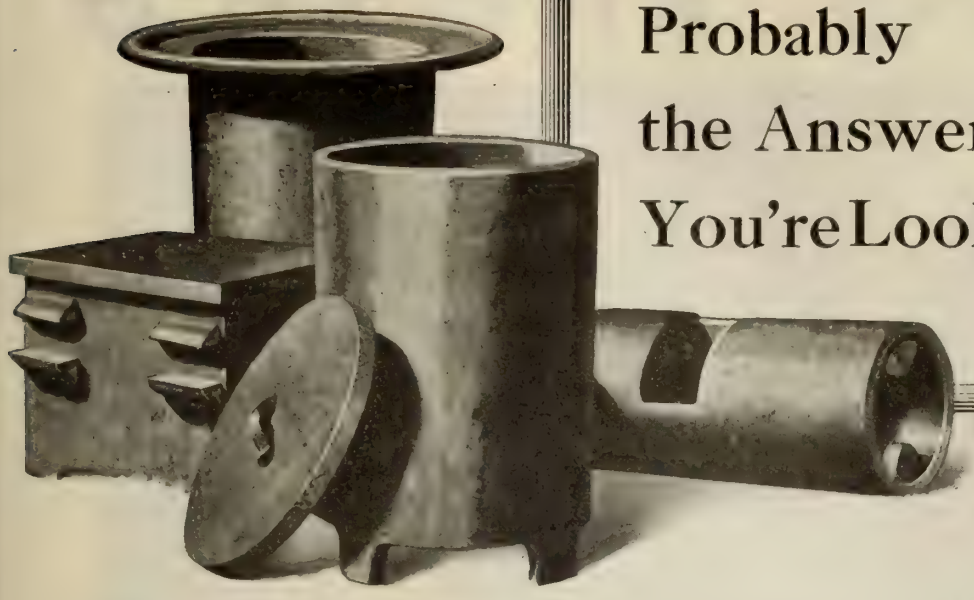
If you like red-blooded fiction with the tang of the race track in it, W. A. Fraser's short story, **"The Thumb Print,"** is sure to satisfy. It's a case of a pair of sleek double-crossers being neatly double-crossed by what they deemed a rich doubble-crosser.

"Whose Bride Was Mary," is a delightful, fast-reading short story of perplexing situations from the pen of Ethel Penman Hoge.

The first of Rev. R. G. MacBeth's thrilling articles on old days with the Mounted Police, "Policing the Prairies," is given complete in this issue. Learn how the Mounties first invaded the prairies in the days of Indian scalp-takers and white "bad men," and in the face of tremendous difficulties.

Incidentally there are two generous instalments of the serials, "Mostly Sally," by Pelham Grenville Wodehouse, and "The Yellow Streak," by Valentine Williams.

What do you know about "Relativity" and the Einstein Theory?—An illuminating summary of Sir Oliver Lodge's explanation of it is one of the many interesting topics dealt with in MACLEAN'S "Review of Reviews."



"Food Facts You Should Know," by William Fleming French, and the regular departments devoted to Finance, Current Humor and Women and Their Work, complete a number bristling with good things.

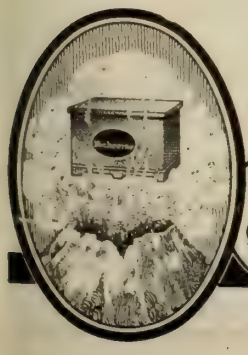
Probably the Answer You're Looking For—

"More Heats per Dollar—More Uniform Results"

IT's the answer that hundreds of other heat-treating men have found in Cast Nichrome Containers. You'll admit that it's a mighty comfortable answer to have when it comes to a showdown on carbonizing economy.

With the Nichrome Service guarantee, economy in container costs is assured; with the uniform behavior of Nichrome Containers throughout their long life, uniform results are assured.



Shorter heats and less fuel consumption are among the other advantages which Cast Nichrome Containers bring with them. Are you ready for the *evidence* of "More Heats per Dollar—More Uniform Results?" Tell us your operating conditions and we will do the rest.

"BLISS" PRESSES

One Thousand "Rests" Per Hour

This No. 19½ "BLISS" Press has been used for six years in making dies, tools and special machines in the Scalbom Mfg. Co.'s shop, Chicago, Ill. It has not once needed repairs or replacements. When photographed it was punching brass "rests"—parts of a special machine for making fiber talking machine needles—at a little better than sixteen per minute, hour after hour.

"Something is learned every time a book is opened" as the Chinese say. Perhaps this particular performance suggests a new application of press work in **your** shop. If so a "BLISS" Press can handle it to best possible advantage.

"BLISS" Presses are rigid, convenient and adaptable, made in a wide variety of styles and sizes and equipped with simple, practical attachments which give them almost unlimited range.

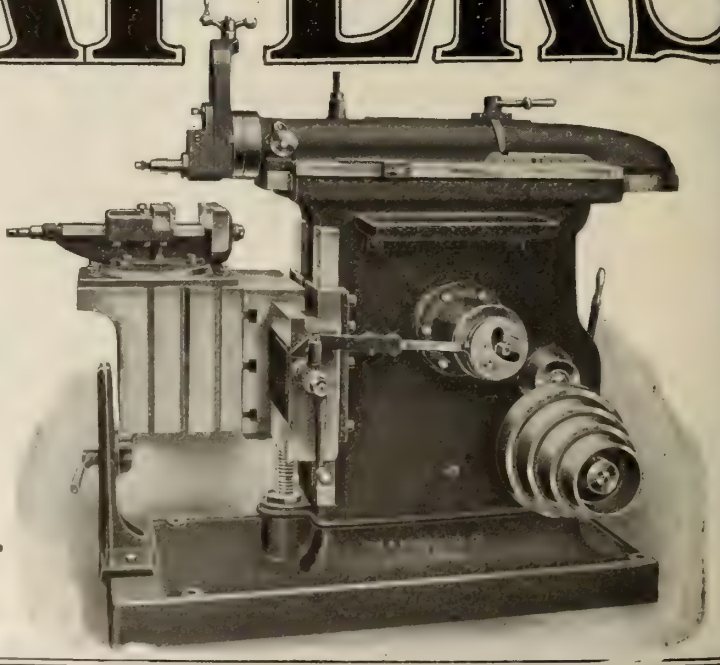
How to Plant an Advertising Crop

Until the advent of the Audit Bureau of Circulations, advertisers sowed their business seed in a vast but fallow field. Some of it grew and returned a fair harvest—much of it was cast upon barren ground and was lost. There was no standardized method of determining the fertility of a publication's field. Experimenting was expensive.



The A. B. C. has eliminated the barren spots of circulation. Planting an advertising crop is no longer an experiment. Advertisers **Know** the field through audit reports. They know whether it is fertile ground and sow their seed accordingly.

The Canadian Machinery circulation has been audited by the A. B. C. Advertisements placed in this publication are seeds well sown.

McDOUGALL SHAPERS

Modern machines characterized by simple, clean-cut design and inflexible rigidity combine the best features of machines hitherto on the market, but with all unnecessary complications excluded.

We shall be glad to send you complete specifications and descriptions.

BROWN & SHARPE

No. 6 Automatic

SCREW MACHINE

The **unusual toolholding capacity** of the Turret is well illustrated below, thirteen tools being employed on this job.

Takes work to 2 inches dia., light work to 2 3-8 in. dia. Turns to 5 inches in length. Feeds to 6 inches in length.

RUGGED CONSTRUCTION: Bed, one piece casting combining spindle housings, cross slide bed, and turret slide bed.

CONSTANT SPEED DRIVE: Spindle driven through gearing and a pair of silent chains, immersed in oil. Four spindle speeds available with each set of change gears, two forward, two backward, through automatic friction clutches.

LARGE FLAT FACE TURRET: Tools bolted directly to face; allows independent adjustment of tools. Turret in vertical plane—gives ample room to swing large overhanging tools without interference with cross slides. (See above.)

It is the machine you should have for economical operation consistent with the quality of work produced

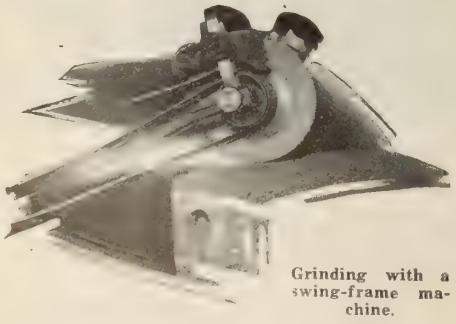
We shall be pleased to send our Screw Machine Catalog 22-G as well as supply further information about this machine.

BROWN & SHARPE MFG. CO., PROVIDENCE, R.I., U.S.A.

Canadian Representative: Canadian Fairbanks-Morse Co., Ltd.

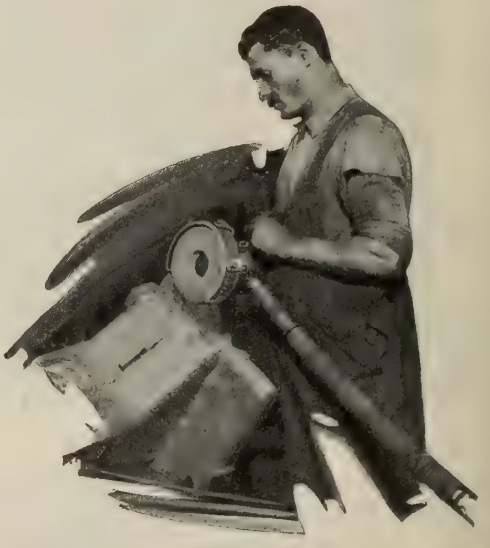
Snagging the Rough Casting With NORTON Grinding Wheels

THE modern way to remove gates and fins from castings, all sizes and kinds, is to use a grinding wheel of correct abrasive, grit, and grade to remove the surplus metal in the least possible time. A slow cutting wheel raises the overhead cost tremendously.



Off-hand grinding on a floor stand.

Use Norton **Alundum** Wheels for snagging all steel and annealed malleable iron castings.



Use Norton **Crystolon** for snagging all gray iron, brass, and aluminum castings.

We will select the proper wheel for you, if we know just what the composition of your metal is, the average size of your castings, and the type of machine you use.

Grinding with a swing-frame machine.

Try one wheel and draw your own conclusions

Flexible shaft equipped with Norton wheel.

Some Miller Problems—How They Were Solved

Milling Machines are Very Versatile — Milling Steel Parts to Within Limits of .002 in. at the Rate of 600 Per Hour—Milling Four Tables At One Time—The Value of Gang Milling

*By H. A. WILSON

THE title "Miller Problems and how they were solved," is in itself interesting. The variety of work which can be completed on such machines is surprising, and in the examples to follow we have purposely varied the work being performed. For example Fig. 1:—

Here we see a straddle milling job. The steel pieces being milled are brought down to within limits of .002 in. at the rate of 600 per hour.

A shop job that is elementary in its simplicity often develops some interesting machines, devices, tools, jigs or fixtures when such simple problems call for work on a large production basis. Such is the case with this instance, and the steel pieces shown are .165 in. thick approximately.

An automatic milling machine is used, and two fixtures are placed on the table of machine, each fixture holding 36 pieces. The operations that are fully automatic, are the table feed; the constant fast travel; the spindle stop, start, and reverse, which latter operation is controlled through plungers actuated by trip dogs on the front of the table. In the photograph shown the pieces in the left hand fixture are being milled by a pair of left hand cutters. When this operation is completed the table motion will be automatically reversed at its constant fast travel of 210 in. per minute and the right hand fixture loaded with steel pieces will be brought up to the right hand cutters. At a proper point the table feed will be automatically engaged, the spindle will start on its right handed rotation and the milling operation on the pieces in the right hand fixture will commence.

While the pieces in the right hand fixture are being milled, the operator opens the left hand vise fixture by a half turn of the handle and removes the finished pieces. The fixture is then loaded with new pieces from a stack on the table, aligning the blanks by means of two hinged plates, one on each side of the vise. The near plates of each fixture can be seen in the cut. When the pieces are aligned, a half turn of handle tightens them in the fixture ready for milling. The operator has plenty of time to empty and load the fixtures, remove finished pieces to the boxes and stack blanks to replace those used in loading. The fixtures themselves are merely modified vises strapped to the table in three places.

Previous to adopting this method of milling the blanks, two fixtures, each holding one piece, were used. Three hundred and fifty pieces per hour were produced, but the work was very fatiguing to the operator. The method described above, increased the production to 600 pieces, and the work is much easier. Two Lincoln type machines were only able to produce together with one operator, two hundred pieces per hour. The summary of the operation as now being taken care of on the machine is roughly as follows: Thirty-six pieces in each of the two fixtures; spindle speed 56 r.p.m.; feed 1.37″ per minute; diameter of cutters 6″; limit demanded 0.002″; stock removed 1-32″ on each side.

Milling Tables

The next photograph, Fig. 2, shows four milling machine tables being machined at one time. It will be noted that the two tables placed in the front fixture are receiving the first cut. After this, they are placed in the rear fixture for the second cut. The tables in the rear fixture are located by the previously milled angle, and on account of the stock removed in the first milling oper-

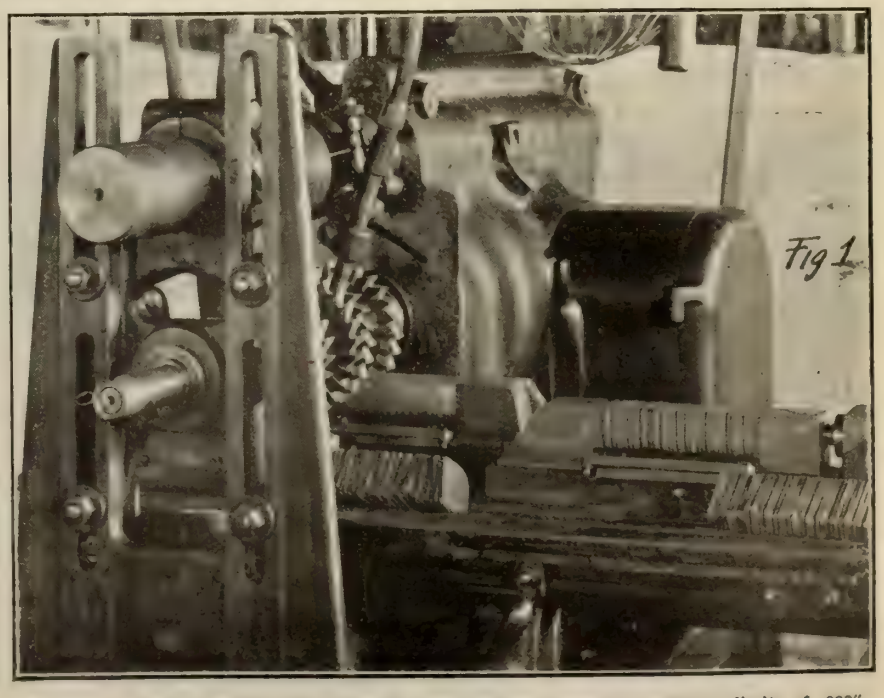

Fig. 1.—A straddle milling job, where the steel sections shown are milled to limits of .002″ at the rate of 600 per hour.

* Note:—The various millers shown in operation are Brown and Sharpe machines. This company is located in Providence, R. I., and we are indebted to them for the use of these illustrations.

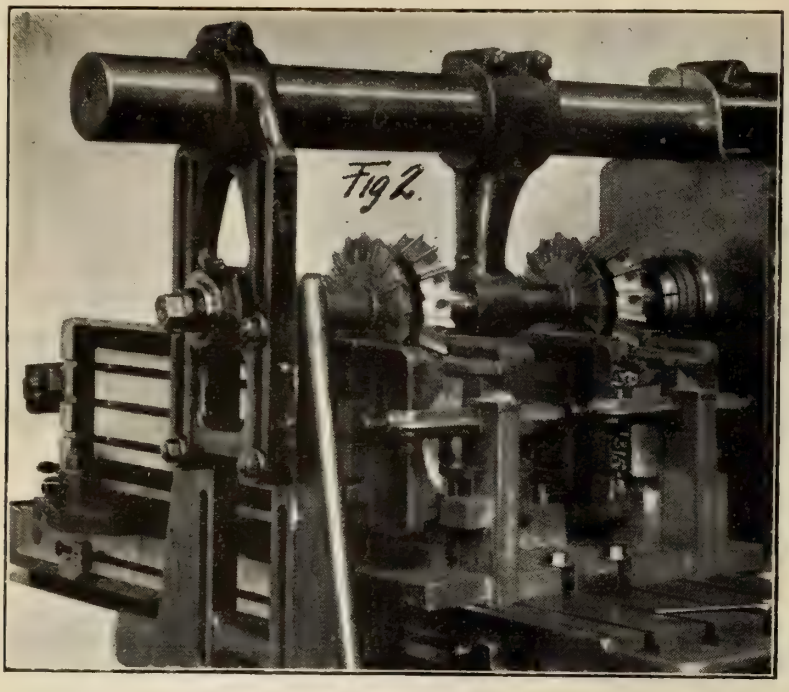

Fig. 2.—Four milling machine tables being completed at one time.

ation, the locating points are higher in this rear fixture than in the first, as the diameter of all four cutters is 9". Four cuts are taken at a time, until the usual lot of fifty is completed. The speed of the cutters is 26 r.p.m. and the feed is 4" per minute. The castings are cast iron, and approximately 1-16" of metal is removed. The length of cut is 54⅜." After the first set up, the changing time is eight minutes. The production time for fifty tables is 30½ hours. During the milling of fifty tables the cutters are not ground. All the angles of the tables are finish planed, after the rough milling operation.

Value of Gang Milling

Fig. 3 gives one a good idea of the value of gang milling, and shows the rough milling of top and bottom of milling machine tables. The set-up is self-explanatory and is of interest mainly from the careful ganging of the cutters, as it includes straddle milling, slab milling, and slotting in one operation. Fig. 4 shows an interesting operation, viz: taking two side milling cuts, the milling of three slots, and the slab-milling of the top surface of a milling machine table. This is a particularly heavy job, but these tables were milled very quickly and efficiently by this arrangement of cutters.

NEW STANDARD MACHINE SCREW LIST

The United States Bureau of Standards and the National Screw Thread Commission have been consulting with manufacturers of machine screws for several years with a view of standardizing the product of this industry and eliminating unnecessary sizes. At the suggestion of the Bureau of Standards, a temporary organization of machine screw manufacturers was formed for the purpose, which was joined by the manufacturers of more than 90 per cent. of the product of this industry, and at a meeting recently held the recommended list of the National Screw Thread Commission was unanimously adopted.

In the new list a considerable number of unnecessary sizes and pitches are done away with. There is a fixed pitch for each diameter in both the coarse and fine thread. The coarse thread pitches are the standard, and screws of these pitches will be carried in stock by manufacturers. The coarse pitches are substantially the same as have been in use for a great many years and no change in shop practice or tools is necessary. Fine thread screws will be made to order only. The most important change from the old list consists in the elimination of numbered sizes above No. 12. All machine screws above No. 12 in the new list will be in fractional sizes and confined to the coarse and fine thread pitches, which meet all manufacturing requirements.

NEW FORMULA

The Du Pont Company has developed and perfected a formula for the manufacture of straight dynamite which results in that explosive being proof against freezing even in zero temperatures. As a consequence of this development, they have determined to discontinue the manufacture of their former straight dynamite and hereafter all this kind of explosive will be made by the new low-freezing method.

ERRATA

In the November 3rd issue we stated that the H. B. Underwood Co., was in New York. This was incorrect, as the above firm is located in Philadelphia.

Milling Flats on 2000 Tappet Rods Every Hour

Value of Suitable Fixtures—Rotary Table—Vertical Attachment And Other Attachments Often Help to Boost Production—Special Fixtures Pay Where Large Quantities are Necessary

*By J. H. MOORE

IN THE previous article by Mr. Wilson, the value of gauging of cutters is shown. This having been clearly proven, we will taken up milling problems of a very different nature.

When large production is essential, its the old story of making a mutiple fixture, and producing the work with as little manual effort as possible. Take for example Fig. 1. Here we see a milling machine equipped with vertical milling attachment and rotary table. the work being the milling of flats on tappet rods for automobile engines. The special holding fixture is mounted directly on to the rotary table, and the fixture accommodates 58 pieces at one time, of course the operators are loading and unloading continuously, as the cutters are always working. A production of 2,000 per hour was obtained by this method, and four men were necessary to take out the finished pieces and replace with rough rods. Even with this production the machine does not go as fast as it might but it was impossible to speed up further, due to the fact that the men themselves could not handle the rods any faster.

* Note:—Figs. 1 to 4 show Kearney & Trecker milling machines in action, while the sectional view, and Fig. 5, depict Kempsmith millers in operation. We are indebted to both companies, who are located in Milwaukee, Wis., for the use of these photographs.

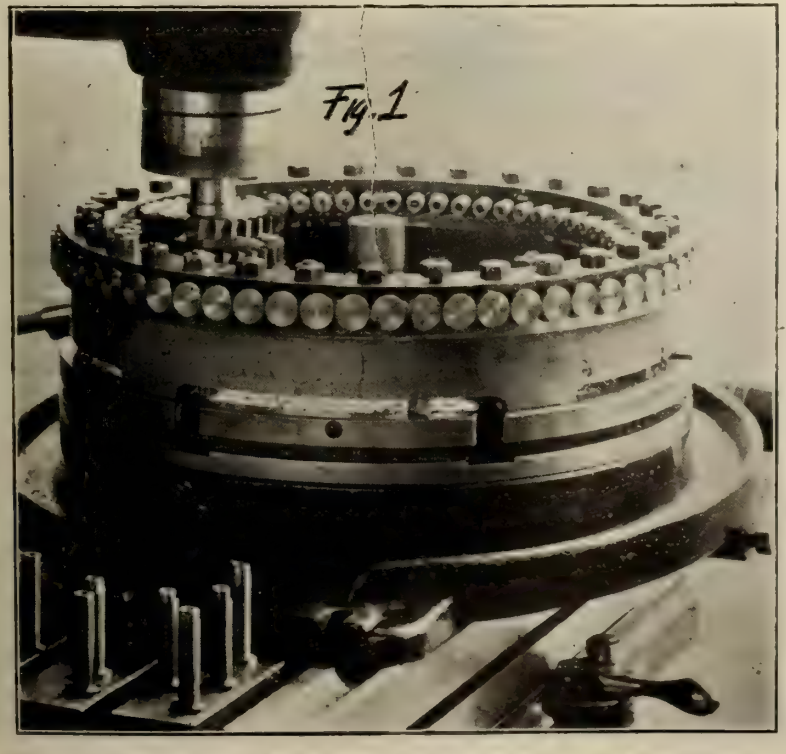

Fig. 1.—Milling flats on Tappet Rods, using rotary table and special holding fixture.

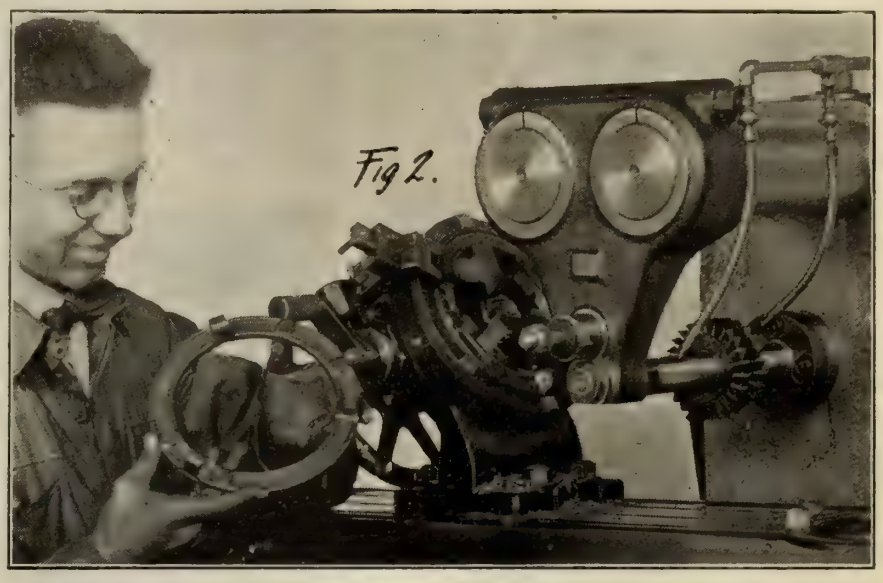

Fig. 2.—Milling a disc clutch for automobile clutch.

Disc Clutch

The next illustration, Fig. 2. shows a special fixture used to hold the ring shown on the table, also in the operators hand. The pieces are made from malleable iron and are part of the Borg and Beck automobile disc clutch. The rings are placed into a hardened tool steel die, and the gauge shown is used to locate the lug in proper location to the indexing mechanism. The ring is held by three clamps, these working automatically by means of the wheel shown at rear of fixture. With one turn of the crank, the plunger shown brings each lug to its position for milling. The actual time consumed in milling the three lugs on each piece is 35 seconds, this including picking up the ring, placing and tightening clamps, milling lugs, releasing piece and placing same on the floor.

The next view, Fig. 3. shows a special holding fixture for milling five steps on the three pads shown in the ring resting on the table. These steps are milled at the one setting, and the holding fixture is clamped to the rotary table, the power for this being furnished through the regular universal joint. which is in turn attached to the feed box of the machine.

The head holding the three auxiliary spindles is arranged to slide up and down, and is operated by means of the cam shown on the side of holding fixture. Each pad comes directly under one of the spindles and then machine is started. As the table and fixture revolve, the cam on the side automatically raises the head holding the spindles, and each step is milled automatically as the table revolves. After the roller in the cam reaches the end, it automatically raises the head, and the rotary table stops. A new piece is then inserted, and the same operation performed.

Drum Fixtures

The photograph at Fig. 4 shows how rotating drum fixtures can be used to

advantage. In this case the two special fixtures shown were mounted on the table, each drum holding two rows of rifle grenades, so arranged that four pieces are in the cutters at all times. The drums are rotated by means of a universal shaft from the feed box to a worm shaft which drives one drum, the other drum being geared up with the first, so that they revolve toward each other. Four inserted tooth, high speed steel cutters are used, and two operators, one at each drum, load and unload. A production average of 800 per hour over a three months period, was obtained, and this work had formerly been done on seventeen lathes, seventeen operators being necessary to obtain the same results. The photograph is so plain that we will leave readers to study the details at their leisure.

Mangle Shoe Job

Ironing machinery for household use requires a long plate or shoe, usually of cast iron, having a curved face which makes an ideal milling job, and one which, due to the good finish required, width of cut, etc., requires a fairly powerful, smooth cutting machine. The cutters and jigs must also be designed carefully, due to the comparatively frail section of the work. The equipment shown at Fig. 5 has given exceptionally good production and finish, on this class of work.

The section of these pieces is very thin and wide, and the length of the shoe varies according to the capacity of the ironing machine in which it is to be used, some being as much as four feet long. The clamping and supporting of such a piece represents some difficulties, but the jigs shown have worked very well in practice. They consist of a right and left end section and several centre sections, the number of which varies according to length of the work.

On one of the end sections there are two solid supports, and on the other only one. This forms a three point support on which to set the rough casting. All of the other various supporting points are of the spring plunger type, which are clamped after the work rests down on the three solid pins, thus adapting themselves to any irregularity in the work, and making a perfect support without the possibility of springing the work, if reasonable care is used.

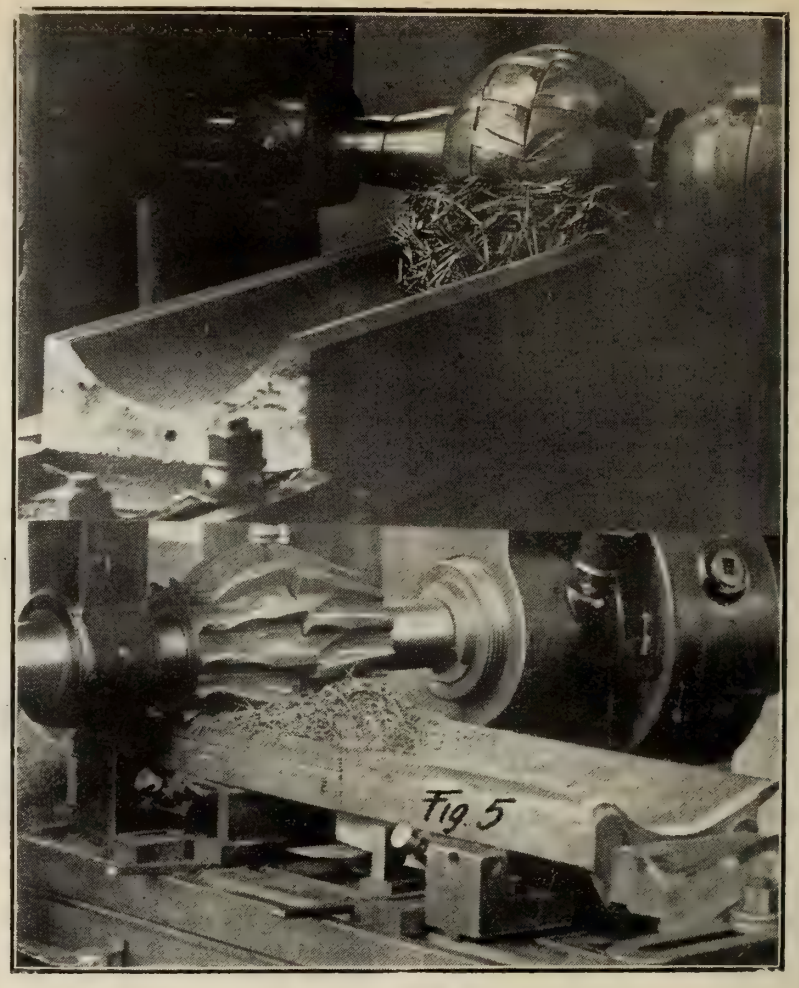

Fig. 5. — Showing the two styles of cutters, old and new.

An interesting point is that the centre of the long pieces must be pulled down about 1/16 inch in order that the piece shall come straight after the scale is removed by the milling cutter. The proper sequence for clamping the work is as follows:—

1.—Set the work on the jig. It then rests on the very solid supports. 2.—

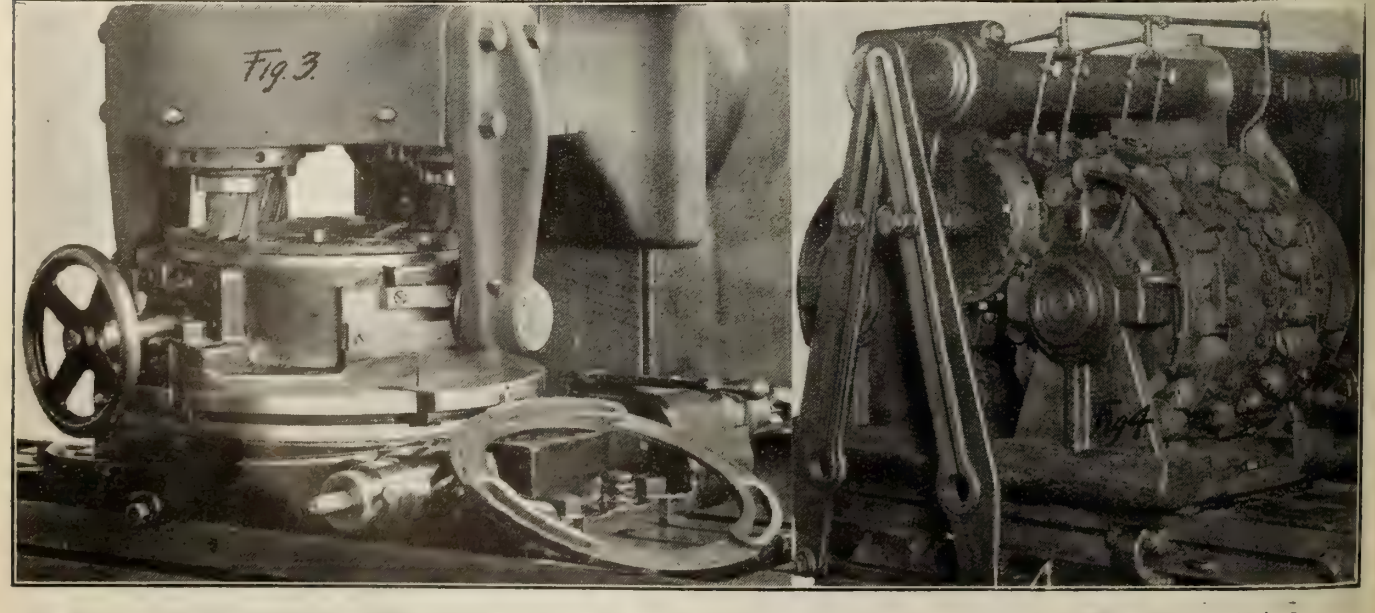

Fig. 3. — Special holding fixture for milling five steps on pads.

Fig. 4—Special rotating drum fixtures for milling rifle grenades.

Tighten the clamp screw on the 4th end support pin, thus giving four point support—two on each end. 3—Pull down the side clamps in the centre until the centre is sprung down about 1/16 inch. 4.—Set up end thrust screws and end clamps. 5—Tighten clamp screws on remaining supporting pins. 6.—Pull having too wide a face for best results.

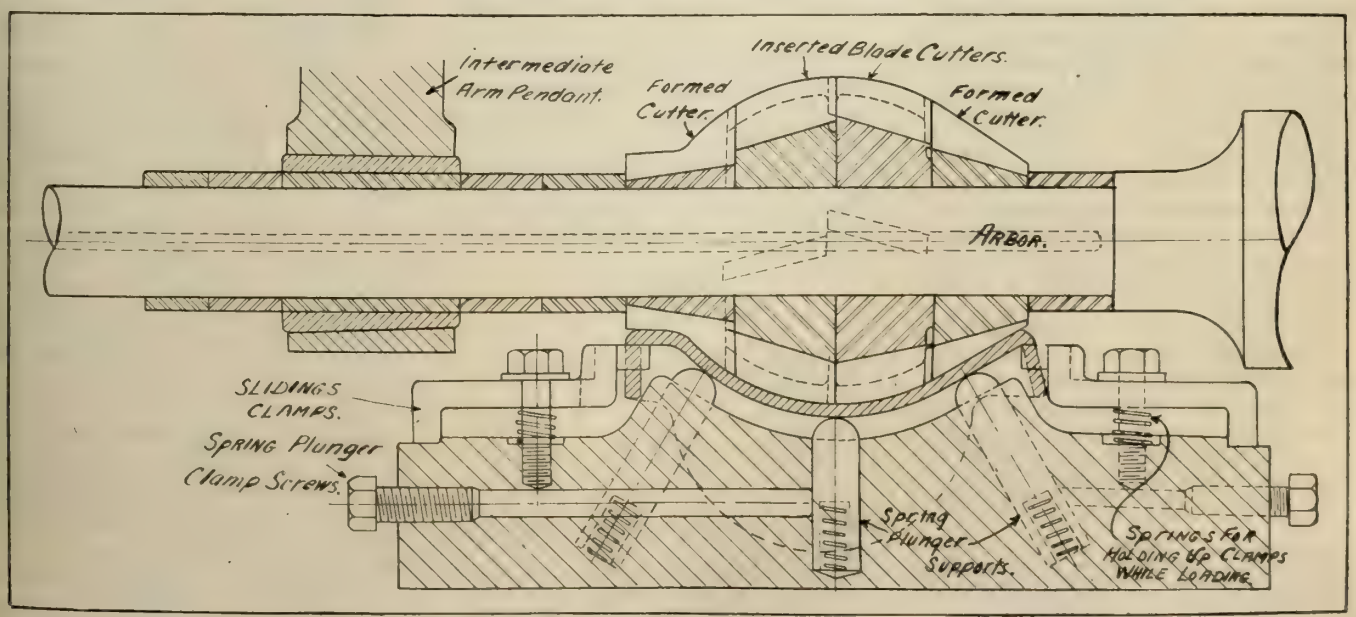
The latest design is made in sections with the larger sections having blades inserted which show plainly in the drawing and photograph. This breaks up the cut giving a more continuous action and better finish. The cutter is kept as small as possible. A special type of arbor drive is used for heavy cuts of this nature, the arbor being flanged and centred on the nose of the spindle without the use of the ordinary taper end, which tends to crystalize and break off even though the driving is done by means of keys.

The photograph shows the old and new cutter set up for trial cuts, although both views show only temporary work fixtures, and are therefore not as satisfactory as they might be. In the one case it will be noted that the cutter is being tested on a cast iron block instead of the actual work.

The sectional view of the proper fixture used will be ample for description purposes.

Much of the success of this job is attributed to the rigidity and smoother powerful speed and feed drive obtained. In this machine used the cutter spindle and the feed screw are driven by worm and worm wheel located directly on the spindle and screw respectively. This forms an ideal drive for smooth action, as proven by the results obtained in finish, life of cutters and production. The production data is as follows:—Cutters= 6 inch diameter at 65 feet= 41 R. P. M. F=2-3/8 inches per minute= .058 per revolution.

VENTILATION RESEARCH



The Pittsburgh Experiment Station of the United States Bureau of Mines is working in co-operation with the Research Bureau of the American Society of Heating and Ventilating Engineers on a number of important problems which affect each individual in his home life, in his place of business, and especially in those places where many people congregate, as in churches, schoolrooms, and theaters. It is important to ventilate such places with sufficient fresh air to make everyone comfortable enough to be able to work at high efficiency. The circulation of excessive quantities of fresh air imposes a considerable cost on the heating system therefore an efficiently designed heating and ventilating system introduces the least amount of cooled air consistent with proper conditions for health. In this connection the use of ozone has frequently been proposed and actually tried in a number of places. The ozone is supposed to deodorize and purify the air by the oxidation of organic matter and possibly by killing bacteria.

It is however, a real question as to whether ozone can be introduced in quantities large enough to kill bacteria without producing very serious irritation of the throat and lung tissues. It is also a question as to whether harmful oxides of nitrogen are not produced simultaneously with ozone. Definite information is needed on this subject. The first step in obtaining such information is to work out methods for accurately determining the percentage of ozone and oxides of nitrogen produced for different types of ozone machines and to develop suitable methods for determining the very small quantities of ozone and oxide of nitrogen that may be in the air treated with such machines. Analytical work of the highest precision is required. The gas laboratory of the Bureau of Mines, Pittsburgh Station, is now engaged on this problem, working in co-operation with the Research Bureau of the American Society of Heating and Ventilating Engineers which is housed in the same building.

After the chemists have worked out the methods of detecting and analysing these small quantities of ozone and oxides of nitrogen, the next problem will be undertaken in a like co-operation of the two agencies just named working with the United States Public Health Service. Surgeons from this service are detailed to the Bureau of Mines for working on health and sanitation problems. The work is being carried on under the joint general direction of A. C. Fieldner supervising chemist and superintendent of the Pittsburgh station of the Bureau of Mines, and Dr. R. R. Sayers, chief surgeon, Bureau of Mines, by G. W. Jones, assistant gas chemist, Bureau of Mines; W. P. Yant, assistant analytical chemist, Bureau of Mines; and O. W. Armspach, engineer, American Society of Heating and Ventilating Engineers.

POWER FROM SEWAGE

It is often said that modern methods of sewage disposal are exceedingly wasteful, because they throw away material which might be utilised to great advantage. Many of the systems developed in Great Britain are free from this reproach, and experiments recently made in the utilisation of gas from sewage show that in an unexpected quarter British engineers are attempting to secure the highest economy. In one large British city a gas plant was installed to give 25 horse power for a working period of six hours per day. It is driven by gas generated from the dry solid matter produced in the process of sewage disposal. The experiment has been most promising, and it has revealed a useful source of power in a district where gas and electricity are not available. The power produced by the sewage gas is used to drive the plant which forms an essential part in the installation for purifying the sewage; thus it affords a most desirable form of economy.

Elements of Machine Design—Lesson No. 3

Theory of the Column — Stresses in Columns — Long and Short Columns—Radius of Gyration — Analysis of Stress—Rankine's Formula—Various Examples Explained in Detail

*By L. T. RUTLEDGE

THE word "column" suggests to the student unacquainted with the theories of structures but who has some ideas of architecture in general, a very high pillar, usually circular in section, of service in a building to support the roof or to adorn the front of the building. In this conection it is considered to be a member which rests on one of its ends and carries a load, transmitting it to some kind of a foundation beneath. It is admitted that this conception of a column is not far astray and quite satisfactory for ordinary cases but it is not broad enough and not complete enough for our purposes. The more general definition of a column is as follows:

When a prismatic piece or member in a structure has a length greater than about six times its least diameter and is subject to compressive stress, this member is designated as a column or strut. The word column applies when the compressive member is located vertically and carries a static load, whereas the word strut applies when the member subject to axial compression rests in an inclined or horizontal position.

When the length is less than six times the least diameter, we have, just simply, a compression block, the stress in which is determined by the simple formula, unit stress equals the load divided by the cross-sectional area. It is incorrect to call such a member a short column. As will be seen in one of the following paragraphs, the short column is quite a different thing altogether.

Columns are subject to a bending stress in addition to the ordinary compression stress. This additional bending stress is caused by eccentricity of loading and the deflection caused thereby. It is quite impossible to apply the load at the exact centre of the column. Besides the axis of the column will not be perfectly straight nor will the material in the column be absolutely uniform and homogenous throughout, owing perhaps to irregularities in casting in the case of cast iron columns or during rivetting or straightening if made of fabricated steel.

The yielding due to non-uniformity is a very serious matter since it brings about further yielding and bending. No two columns will act exactly alike under stress so it is impossible to anticipate most accurately the condition of stress. However, thousands of tests on loaded columns have been made under variation of every condition that could be imagined to affect the results and as a consequence certain formulae and constants have been established which when used intelligently give results that can be depended upon in design.

Long and Short Columns

For purposes of analysis of stress, columns have been divided into two main classes, namely, long columns and short columns, in both of which initial inequalities introduce serious bending. It is apparent that the amount of bending will increase with the length of the column. Ordinary experience confirms this assertion. Long columns fail by buckling or sudden collapse at a load which in a short compression block would cause a stress far below the elastic limit of the material, whereas short columns begin to fail when the combined stress due to compression and bending reaches approximately the yield point of the material.

The factor which is used to divide columns into the two classes is called "the slenderness ratio" denoted by $\frac{l}{r}$ the quotient of the length, to be exact the unsupported length, and the least radius of gyration, both in the same unit, generally inches. This brings to our attention a new quality which will now have to be explained.

Radius of Gyration

In the derivation of the flexure formula for beams use was made of a quantity "z" which was the distance from the neutral axis to the centre of gravity of the elementary strip or section. The z was raised to the second power in the expression for moment of inertia. It was seen that for absolute accuracy it would be necessary to choose an infinite number of elementary areas with a corresponding infinite number of z's. One might imagine that for the infinite number of elementary quantities of the order of

$$z^2 \delta A$$

which are afterwards aggregated that some average value for the

$$z^2 s$$

might be used which when multiplied by the total area of the section would give the total moment of inertia. This is exactly what is accomplished by the radius of gyration. The radius of gyration of a section is the distance from the neutral axis to a point where, if the total area of the section could be concentrated and multiplied by the square of this distance, the result would be the moment of inertia of the section. Thus using the ordinary symbols,

$$I = Ar^2 \quad \text{or}$$

$$r = \sqrt{\frac{I}{A}} \quad \ldots\ldots\ldots (20)$$

Example 1.—The moment of inertia for a 2" x 12" section about the neutral axis parallel to the short side is 288. Find the radius of gyration of the section.

Given that $I = Ar^2$ and $A = 24$ sq. ins. then $r^2 = 288 \div 24 = 12$, then $r = 12 = 3.46$".

Example 2.—The web of a 12" steel I-beam @ 31.5 lbs. about an axis through its centre of gravity and parallel to the flange is 215.8 as given in the Cambria handbook. The area of the section is given as 9.26 sq. ins. Determine its radius of gyration about the same axis.

$r = I \div A = 215.8 \div 9.26 = 4.83$ ins. which is the value given in the handbook.

Mark's handbook is inclined to consider all columns which have a slenderness ratio 100 or less short columns and those which have a slenderness ratio greater than 100 long columns. In Merriman's Mechanics of Materials the following division is made: Where $l \div r$ is between 25 and 200 the column is considered as a short column and where the ratio is greater than 200 the column is in the class known as long columns in which failing is generally due to bending alone. Merriman states that almost all columns met with in engineering practice have slenderness ratios varying from 50 to 150 so that they must be treated as short columns and the mathematics of short columns applied. The writer is inclined to consider the value 200 as too high but also 100 as too low. He would consider 140 as the limiting value for short columns. In machine design columns with $l \div r$ greater than 100 are practically never met with so that the short column is the one that shall be given preference and studied in detail.

Besides the conditions causing failure as mentioned above, the strength of columns depends on the conditions of the ends. Columns are divided into classes according to the manner in which the ends are fastened as follows:

(a) Free ended columns as for example the column of a high drill press or a flagpole both of which have one end

*The author is Professor of Mechanical Engineering at Queen's University, Kingston, Ont., and should any reader wish help in any problem on mechanical matters, Mr. Rutledge will be only too pleased to offer assistance. To save time, write direct to Kingston, explaining your trouble in detail.

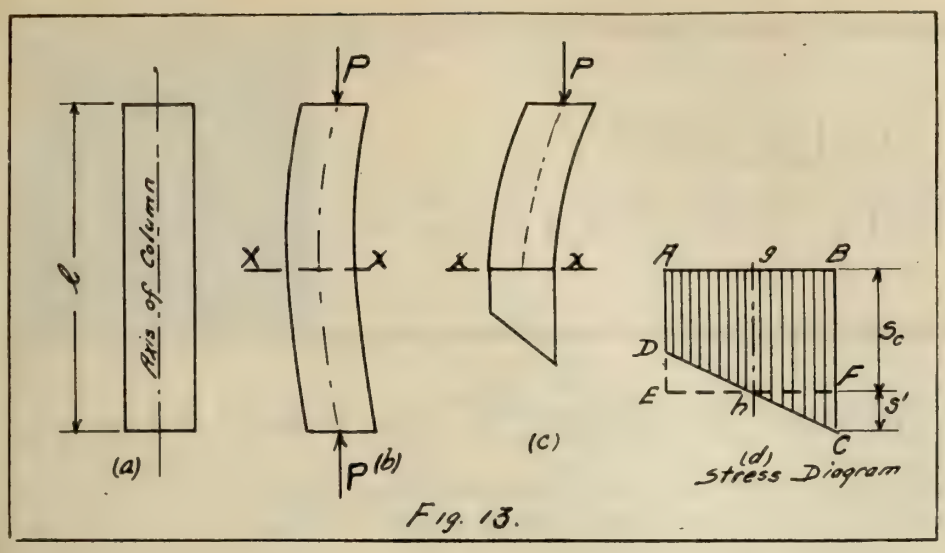

Fig. 13.

free; (b) Round-ended, as is the case where the end has a spherical end; (c) Fixed-ended, when rigidly connected like a compression member in a steel bridge or a steel column in a building; (d) Square-ended, as is the case in mill building construction, where a square ended or flat column rests on a support; (e) Combinations of any two of the preceding. Everyone recognizes the fact that a column with fixed ends is stronger than one with round ends or one with a free end. The square or flat ended column is about as strong as the fixed ended column.

Analysis of Stress in Columns

The theory for the stress developed in columns will herein be developed without considering the weight of the column. If the compression member is in a vertical position, its weight makes practically no difference to the stress but if the member is in a horizontal position then its weight causes bending or flexure stress as is the case in a beam. This latter condition demands more attention than the former.

Long columns are usually designed by Euler's formula or some modification of it and short columns by Rankine's formula or some modification of it. But as stated above, our attention will be concentrated on short columns, therefore we shall devote our attention to the derivation of Rankine's formula and the application of it.

RANKINE'S FORMULA:— Assume a short column of unsupported length l, of cross-sectional area A least moment of inertia I, the least radius of gyration r, and also assume the distance from the vertical axis of the column to the remotest fibre on the concave side to be (c). Let P be a load applied on the top of the column as close to the centre of the end of the column as is possible to apply it.

Fig. 13 (a) shows the column as it appears when unloaded; Fig. (b) shows to an exaggerated scale the column deflected by the load.

The total stress at any section of the column equals the sum of the stress due to straight compression and the stress due to bending. The stress due to simple compression equals $SC = P \div A$,

A typical section is taken at x——x. The amount of the compression stress is given in Fig. 13 (d) by the line gh or BF.

The maximum stress due to bending which we shall denote by the symbol S^1 is obtained by the use of the flexure formula $S \div C = M = I$ so that,

$$S' = \frac{Mc}{I}$$

Where C = the distance from the axis to the extreme fibre on the concave side where the stress is S^1

I = the moment of inertia of the section.

M = the resisting moment of the stress which is equal to the external load multiplied by the deflection of the axis at the section under consideration which in this case is at the middle of the column. Let the deflection be y which is a maximum value for the deflection in this column. Then the resisting moment is Py.

The stress S^1 is shown as a compression stress at 13 (d) by the line FC and as a tension on the convex side by DE which stress neutralizes an equal amount of compression and AD is the resulting stress on the fibre which is seen to be much less than the stress on the concave side.

$$S = \frac{P}{A} + S'$$
$$= \frac{P}{A} + \frac{Mc}{I}$$
$$= \frac{P}{A} + \frac{Pyc}{I}$$

Also $I = ar^2$ and for a beam

$$y = K\frac{l^2}{c}$$

The proof of which is given later in this discussion. Accepting the above for the meantime then

$$S = \frac{P}{A} + \frac{Pcy}{Ar^2}$$
$$= \frac{P}{A} + \frac{Pc}{Ar^2}\,\frac{Kl^2}{c}$$
$$= \frac{P}{A} + \frac{KPl^2}{Ar^2}$$
$$= \frac{P}{A}\left(1 + K\cdot\frac{l^2}{r^2}\right) \quad \cdots (21)$$

which the expression of Rankine's formula for short columns ..... (21).

The total maximum stress equals then

the $\frac{\text{total external load}}{\text{cross-sectional area}}$ multiplied

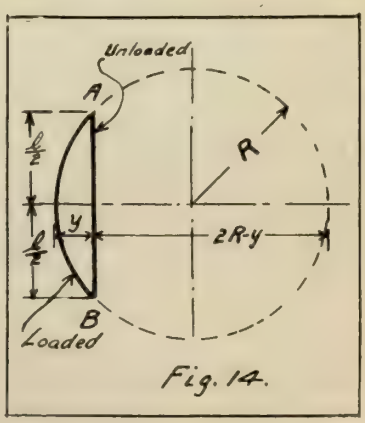
by the quantity

$$\left(1 + K\cdot\frac{l^2}{r^2}\right)$$

The factor K depends for its value on the material and the condition of the column ends. Its value is determined experimentally.

Because of the fact that assumptions are made in the above derivation and because the values of k are derived by experiment, the formula is somewhat empirical in nature, yet it is of great value and with careful determinations of values for k, the formula gives accurate results. The accompanying table gives values for "k" for various materials with different end connections.

Proof that $y = \frac{Kl^2}{c}$



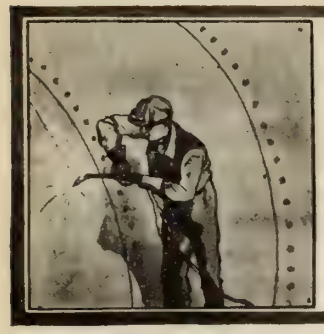


Fig. 14.

Assume the curvature of the column to be circular which is approximately correct, y being the deflection in inches at the middle point.

Let R = the radius of curvature of the bent axis of the column in inches.

l = the length of the column in inches.

(Continued on Page 44)

WELDING AND CUTTING

Various Hints on How Welding Can Save Money

Have You Made a Survey Lately of Your Manufacturing Plant—This Story Tells of An Inspection of this Nature—Places Where Money Can be Saved

*By G. E. HARCKE

IT IS quite the fashion nowadays to make surveys of all sorts of things to promote philanthropy, religion, manufacturing efficiency and other activities in which men and women are interested, and the following story tells of an unofficial survey by the author of the toolroom and machine department of a large Eastern U. S. manufacturing plant to show how the oxy-acetylene torch could be used to advantage. As stated, the survey was made unofficially and without previous intention, resulting from the stiff-necked attitude of the superintendent who derided oxy-acetylene welding as an obsolete process. It developed that the superintendent had only a smattering knowledge of welding, or the many applications that could profitably be made in his own province. He finally admitted that the possibilities were to him a great surprise. As a result, a tour of the departments was made with the following results, in part:—

Extending a Bolster Plate

A big pillar press was set up for a drawing job, and the die was supported on a bolster plate too short for the purpose. As the result, the holding down bolts clamped the ends of the bolster insecurely, resort having been made to washers and other togg'ed-up parts to furnish sufficient clamping effect to hold the die in place. Trouble had been experienced due to the insecure clamps giving way and the question was asked why a new bolster plate had not been provided.

Objection was raised that the job was a short run only and that they could not wait to have a pattern made and obtain the casting from the foundry; the job could not stand the expense of a new bolster in the first place and time could not be spared to make it even if the expense were warranted. Thereupon it was pointed out that the ears of the bolster plate could be very readily extended at small expense, and with very little loss of time. The superintendent was shown that it was not necessary to resort to the practice of making a new casting every time a change was required in a bolster plate, but that a mechanic properly trained could, in a few minutes, build on lugs, ears and bosses which would be as strong and dependable in service as though cast with the body in the foundry.

Building Up a Die Block

The next thing found to illustrate the value of the torch was a die block. Die blocks in stock, planed to standard thickness were too thin for a certain job, and it appeared that it would be necessary to make one up special, three-quarters inch thicker than the standard. This meant delay and high cost because of having to make one only. But the job was easy for the torch operator. It meant simply preheating a standard block and laying on the required amount of adding material to make the thickness required. Thus a block ready for laying out could be finished while an order was going through for a special one.

Repairing Morse Taper Shank Drills

In the toolroom a number of Morse taper shank twist drills lay on the workbench having the tangs twisted off. Preparations were being made to anneal the shanks so that new tapers could be turned and tangs milled. Here, indeed was a fine proposition for reclamation. A welder could readily build up a new tang using drill rods for adding material. "The time required for an ordinary shank should not be more than ten minutes," said the author of this article, including that required for slight preheating. When the building up process is finished the rough tang can be ground on a wheel to standard thickness and width.

Cutting Screw Machine Cam Blanks

Another job that claimed attention for a few minutes was a set of cam blocks for a Brown & Sharpe screw machine. These cams are made from steel plate, and are cut to the required contour on a special cam cutting machine that is geared up for the job. The ordinary procedure of cutting out a cam blank requires laying out and drilling a row of holes in the plate, the layout following the shape of the cam desired. If drilled out, the cam must be roughly worked out to a near size before it can be placed on the cam cutting machine for machining. The superintendent was shown how such jobs are easily done with the hand cutting torch, it being possible to cut out the cam so smooth and true to shape that comparatively little excess metal is required for finishing on the machine. He was also told that when sufficient of this class of work warranted the oxygraph had been found to be a very profitable investment for this and similar parts.

Removing Broken Taps

A little further on they stumbled over two dies that were to be taken to the heat treating room for annealing. The reason the dies had to be annealed was that taps had been broken off in each, and heating in a gas furnace was the only way available of softening them so that the broken taps could be drilled and removed. It was pointed out that the torch could be used to advantage to soften the taps themselves without annealing the entire die, and that it was quite feasible to work them out when softened in this manner.

The Torch a "Putting on" Tool

A number of spoiled shafts then received attention. The workman had made a mistake in reading the blueprint, and had turned a section on each to less than the required diameter. Building up with the torch to restore the lost metal would cost perhaps $10 including the overhead, and thus shafts worth probably $300 could be reclaimed.

Nearby was a worn crankshaft from a large press. The bearings were being turned down, and new bronze bearings were being bored to fit. It was pointed out that the worn bearings could also

* Author is director Davis Bournonville Institute.

be restored to the original size by adding metal, and fitted to the old bronze bearings. The saving would have been considerable both in labor cost and machine time.

Chipping old babbitt out of worn boxes is a disagreeable and tedious task but a necessary one if they cannot be safely heated to the temperature that will melt the babbitt out. The torch affords the millwright the means for readily melting out the babbitt and making boxes ready for re-babbitting. An example found on the way brought out this application.

Bending Levers With Aid of Torch

Certain kinds of wire-working machinery are fitted with a variety of cams and levers. The levers are necessarily bent to clear other parts, and when these machines are made in small lots it is customary to form the levers of iron or steel and bend them to the desired shape when assembling. It is difficult to localize heat with a gasoline torch so that the bend will be insured exactly where it is desired but the small flame of the oxy-acetylene torch can be concentrated within a small fraction of the inch of the desired location and hence bends can be made with great efficiency.

The author said that a man who new how, could make metal do astonishing corkscrew stunts when persuaded with the tiny white hot flame.

Repairing Broken Gear Teeth

In this plant many of the special machines contain large numbers of gears, and breakage of gear teeth is by no means uncommon. A broken tooth usually means that the gear is scrapped and a new one made to take its place. In some cases this may be cheaper than reclamation but in other cases substantial savings could be made by welding in metal and recutting on a gear cutter, thus restoring the gear to good condition.

Safety Work With The Torch

Safety work has made it necessary to provide a great variety of gear guards, and flywheel screens in manufacturing plants. The usual old-time practice in working out a gear guard using sheet metal is to cut the parts to the required shape, bend them, fasten on lugs and angles with rivets, or bolts. The work involves a great deal of labor; in many cases vibration soon loosens the fastenings, and repairs are frequently necessary. Such guards can be made with the aid of the welding and cutting torch at comparatively low cost, the cutting torch being used to form the parts, and the welding torch to unite them. The resulting product is strong and indestructible; it will last as long as the machine. Vibration cannot loosen the joints.

Repairing Pipes, Stokers and Hydrants

A leaking pipe called attention to the need of a pipe fitter. Inspection showed it would be necessary to take down replace the defective fitting, or it would be necessary to cut the pipe and insert a union. Either method involved about fifty feet of this pipe and also considerable expense and some new material. The author said that the leak could be repaired with a torch without disturbing the pipe, it being necessary only to shut off the pressure and drain it for the time required for welding each end of the fitting, a period of about twenty minutes.

Copper tinning kettles are costly equipment and with the best of care they spring leaks and require repairs. The torch settles such matters without trouble. No trip through a manufacturing plant is considered complete until the visitor has been taken through the power plant and shown the engines and boilers. It so happened that the fireman was stoking the boiler by hand although it was fitted with an automatic stoker. Inquiry revealed the fact that the stoker was temporarily out of commission owing to the breaking of a carrier bracket. This being a special form is was necessary to obtain a new one from the manufacturer and considerable delay was anticipated. The carrier bracket could easily have been welded by a fairly expert welder in two or three hours including the preparation time.

Walking from the boiler room into the yard brought the "surveyors" to a broken hydrant. Because of this hydrant being out of condition it was necessary to shut off the water from part of the plant, thus the insurance on that section was invalidated for the time being. The fracture in the hydrant could have been welded with the torch in half a day and the total time required for removing, preparing, welding and replacing should not have taken more than a day's time. As this would have been done during the daylight hours the risk involved from lack of fire protection would have been practically negligible.

These examples mentioned are only part of all that come up in the course of a tour but they will serve to illustrate the manifold uses that can be found for the oxy-acetylene torch in the average manufacturing plant. The superintendent was convinced but surprised to know how such a useful tool could be practically applied to take care of the jobs that could be reclaimed with it. The question being put to the author he answered as follows:

"The way to meet the situation is to train one of your best mechanics to use the torch. He should have a station in some accessible part of the plant where he can be readily reached by all the departments. The heads of departments should be instructed in the possibilities of welding and directed to send all parts to this station that can be profitably reclaimed. I would suggest that you take Harry Blank for the job as I happen to know that he could fill the bill very acceptably."

The superintendent was horrified at the suggestion of taking one of his best all-round men, and countered with the suggestion that one of the sweepers be trained for the job. Later on however he became convinced that the all-round mechanic was the best proposition in the end.

INDUSTRIAL RESPIRATORS

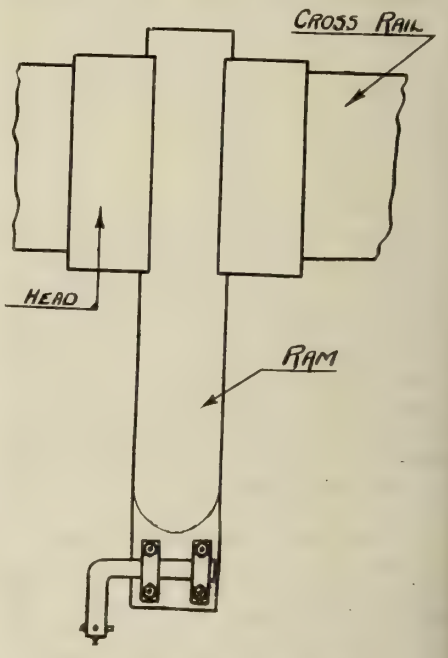
Before the war, respirators specially designed for use in industry were, practically speaking, non-existent. Experience with respirators as protection against poison gas during the war, however, has been turned to good account from the industrial point of view and Dr. Leonard Levy, at a recent meeting of the London Section of the Society of Chemical Industry, gave an account of latest developments that have been made in the face-piece of respirators over the type used in the Army, but the canisters employed are unused small box respirator canisters of the type used in the Army, which it has been found difficult to improve upon, and, moreover, they happen to be readily obtainable in large quantities. The fillings of the canisters, however, are quite different from the Army fillings. For industrial purposes, there are now ammonia respirators, which find extensive application in cold storage plant, and for which the most satisfactory absorbent has been found to be crystalline copper sulphate.

The next type gives protection against neutral vapors, such as hydrocarbon fumes in oil fields, cleaning out oil tanks, etc., and here the best results have been obtained with a filling of highly activated vegetable charcoal. A third type is designed to deal with acid gases, such as hydrochloric acid, chlorine, sulphuretted hydrogen, phosgene, sulphur dioxide, nitrous fumes, hydrocyanic acid, etc., and in this case it has been found that a uniform mixture of alkaline granules and charcoal has the longest life. The alkaline granules made use of by the author are slaked lime, diatomaceous earth, ferric hydroxide, and activated charcoal. Finally, there is the carbon monoxide respirator, which has presented many novel problems, because there is no known absorbent suitable for use in a respirator canister for the removal by chemical absorption of carbon monoxide. A thoroughly effective method ed with this gas. An effective method, however, is by the catalytic oxidation of the carbon monoxide by the oxygen of the atmosphere, using certain special mixtures of oxide, such as finely divided manganese dioxide, copper oxide, cobalt oxide and silver oxide. Moreover, as carbon monoxide gives no indication of its presence, it is necessary for a detector to be embodied in the respirator, so that the wearer can be warned if the respirator has accidentally failed.—Compressed Air Magazine.

Slotting the Inside of a Large Stator Ring

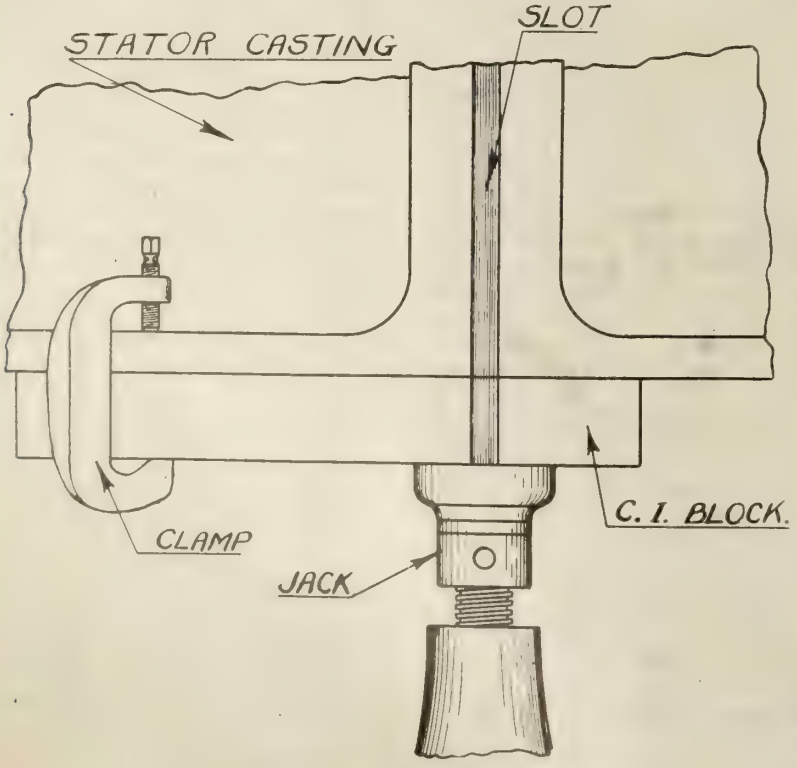
By H. A. WILSON

A SHORT time ago we published a description of the boring and facing operations on a stator ring at the Dominion Engineering Works, Lachine, Que. In each of the quarter sections of the ring fifteen slots are cut, or sixty in all, these slots being roughly ¾ inch wide and ½ inch deep. This operation was done with the stator ring still mounted on the table of the boring mill. The finished bore of the ring was carefully laid off and the location of the slots marked with scratch awl and centre punch. The original intention of the engineering department was to place an end on the ram of the boring mill and drive this mill by means of an electric motor and a reduction gear. However, a faster method was devised by employing the ram as a slotting machine head.



A reversing motor used to raise and lower the cross rail, was connected so as to operate the ram. A large pulley was placed on the motor, so that, running at ordinary speed, the motor caused the ram to travel up and down at the rate of about twelve feet a minute. The ram is equipped with the "European," or four-studs-and-two-strap type of tool holder. This holder was used to clamp on a piece of steel 2½ inches square, which was used as a small tool holder, as shown in Fig. 1. This allowed the tool to be fed into the work squarely and not off centre. The tool was made from high speed steel, ground very similar to that of a planer tool.

One man and a helper are necessary to operate the mechanism. The slots cut are approximately 45 inches long. Two chalk marks are placed on the ram, and when these marks register against another mark on the vertical guides of the ram, it is an indication that the end of the stroke has been reached. The helper is stationed at the platform on the cross rail, and the portable reversing switch of the motor is led to him. When the marks on the moving ram register on the marks on the stationary guides, the helper reverses the motor. From his position he can operate the hand feed which gives the transverse motion to the head and ram, on the cross rail. The tool is fed into the work by this hand method and cuts on the down stroke.



The width of tool determines the width of slot, but the depth is checked by operator with a depth gauge. He directs the helper at the beginning of each cut, and he in turn feeds in the tool at the top of each stroke. When the slot is near the required depth the operator gauges it carefuly after each cut, and signals the operator the depth of the last cut or two to bring the slot to the proper depth. All gauging by the operator is done at the top of slot, and as soon as the depth is obtained at this point an extra stroke or two is taken to overcome any tendency of tool to spring out and cause the depth at bottom of slot to be shallower. The overhang of the tool holder and ram is very great at the bottom of the stroke and, although they are very rugged, the slight tendency to spring shows up when delicate measuring instruments are used. At the bottom of cut a cast iron block is placed and the tool, in machining the slot, cuts through the stator ring into the iron block, thus preventing the ring from being chipped on its lower edge.

The regular main motor that operates the mill is used for indexing. The table is moved by power from one slot to another. A disc with holes in it to accommodate a bar is placed on the end of the motor shaft and the bar is used to move the table around to its exact position for the next slot to be machined. The writer saw a tool working that had machined thirty-four slots, yet had not been re-ground once. The reason the slots were laid off and marked in preference to using a gauge or some other form of mechanical indexing, was that an error in a gauge would be cumulative, and an indexing apparatus which would be accurate on this large circle, 27 ft. diam., would be very expensive. Each slot is gauged with a standard gauge or key, and this determines its size. Its position is checked by a gauge having three small projections on it. The latter gauging only serves to confirm the accuracy with which the slots were laid off and marked.

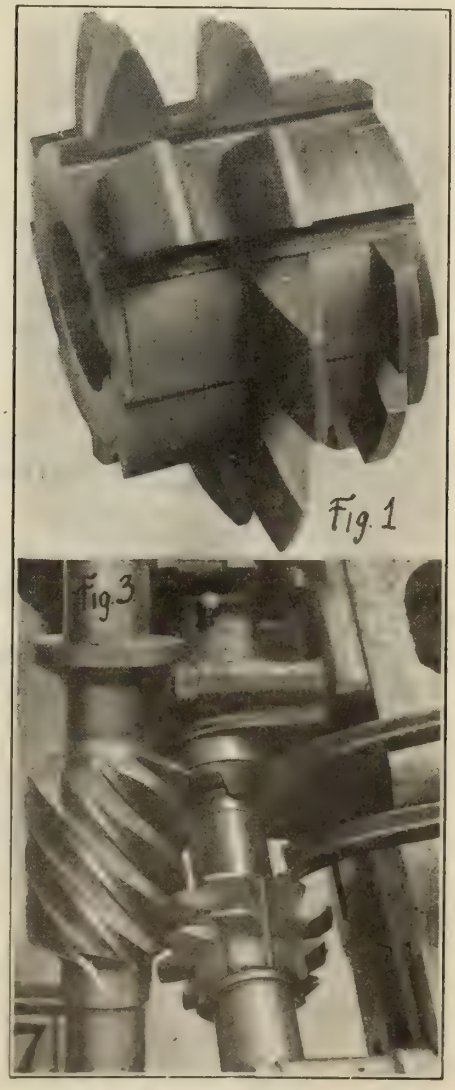
The sixty slots were machined in a little over four days. The method of machining left a great deal of responsibility on the shop foreman, and very little on mechanical devices. However, the mechanics at this plant are accustomed to large work carrying with it a great deal of responsibility, and where an error would run into a large sum of money. The ingenuity displayed when a job turns up for which there are no special tools, or jigs, on hand, is worthy of a great deal of admiration.

Showing How Tool Was Arranged

Showing how the casting was supported.

Interesting Method of Manufacturing Worms

Hobbing Method of Producing Worms—Special Helicoidal Cutter Used—Action of Hob—Examples of Work Performed—Field of Usefulness for Such a Process



THE screw or worm and its mating gear constitute an extremely ancient combination. The compactness and simplicity of design, and large speed reduction attainable by using worm gearing, make it peculiarly applicable to many types of mechanism. When rigidly mounted and properly lubricated, this gearing is practically noiseless, and one of the efficient means developed of transmitting power between shafts lying in different planes. Worm gearing has not been used in the past, to as great an extent as its merits would seem to indicate. This has been due principally, to two reasons; first, the difficulty of producing correct multiple threaded worms, and worms with an excessive helix angle, second, the inability to successfully produce correct worm gearing of small velocity ratio, approaching one to one.

Most worms are made with helicoidal teeth, and this article will deal with worms having teeth of that contour. The axial plane of a helicoidal worm is a plain involute rack section, the teeth of the mating gear, at the central plane, will have involute curves thereon, unrolled from the basic rack. A single threaded worm with a moderate helix angle, can be successfully threaded in the lathe. The lathe tool used, can be set parallel to the axis of the worm, or can be set normal to the tooth helix. In the first case, it would be necessary to reverse the worm after finishing one side of the thread, and then cut the opposite side, due to the impractical cuttng angles otherwise obtained on a double sided cutting tool. When a straight sided tool is set normal to the tool helix of the worm, a modified form is produced in an axial plane, and the hob used to cut the mating wheel must be changed to correspond.

The Evolution

With the evolution of the machine tool industry and the development of machines which in production far outstripped their predecessors, the process of milling worms with a disc cutter was originated. This method answers very well for single threaded worms, and is much faster than cutting the threads in a lathe. To obtain a worm with true helicoidal teeth, with straight sides on the linear or axial section, it is necessary to correct the shape of the disc cutter, owing to the interference of the cutter and the helicoidal surface on the worm tooth. This is done by forming a lead or cast iron disc to the proper contour, and using it as a template in making the cutter. If the above process is not employed, the advantage of having a basic rack section, and conjugate teeth on the mating wheel, unrolled therefrom, is lost. Such a formed cutter, of course, can only be used to thread worms for which its tooth contours were intended. Worms of different diameters, threads or linear pitches require special cutters.

The Gould & Eberhardt Co., Newark, N. J., after extensive research and numerous experiments. have developed a novel method of hobbing worms. This method is said to be as far in advance of worm milling with a disc cutter, as the latter was superior to the old process of cutting the threads of worms in the lathe. Speaking on this new method the company says that the production of multiple threaded worms by lathe or thread milling process needs intermittent indexing motions, either hand or automatic, with the inevitable resulting inaccuracies. The hobbing method, with progressive and continuous indexing, entirely eliminates this objectionable feature. In the hobbing of worms, either single or multiple threaded, a hobbing machine is used, with the gearing ratios throughout so chosen that a velocity ratio of one to one is readily obtainable between the cutter and work spindles and the machine operated just as when cutting helicoidal gears. One of the novel features of this new method is the helicoidal cutter employed which also permits worms to be hobbed which have a shoulder on either or both ends.

Figs. 1 & 3. — Showing hob also rough threading operation.

The hob is illustrated in Fig. 1 and exemplifies several distinctive features. The teeth are arranged in a helical formation similar to gear hobs. There are about fourteen roughing and three finishing teeth. It will be noticed, that there are only about one and one half convolutions of teeth, thus making the hob much shorter than gear hobs, the length being about twice the normal circular pitch of the worm.

The action of the hob is in the nature of a progressive roughing and finishing operation. The roughing teeth have their tops and sides reduced in regular decrements, starting with the last finishing tooth, and ending with the first roughing tooth. This portion has somewhat the appearance of a spiral, the lowest tooth is made high enough to cut into the periphery of the worm as far as its centre line, while each succeeding tooth takes out a littlte more metal, ending with the finishing teeth, which smooth and complete the worm tooth shape. The arrangement of teeth just described, and the cutting action secured thereby, make the hob analogous to a broach coiled around a cylinder. The removal of metal is accomplished progressively, and distributes the cutting action over all teeth.

If the hob is made in the ordinary manner, it will be found that the following side of the hob teeth will, if incorrected, cut away a part of the worm tooth, from the pitch line to the outside diameter of the worm.

This necessitates a different lead on the two sides of the teeth, the leading side being made to the basic lead calculated from the normal circular pitch. The following side is recut to a shorter lead, sufficient to clear the theoretical contour of the worm tooth.

When the machine is set up, the middle finishing tooth is centered with the axis of the worm. The roughing teeth lead, and the finishing teeth follow, in the direction of hob rotation. The production and accuracy attainable with

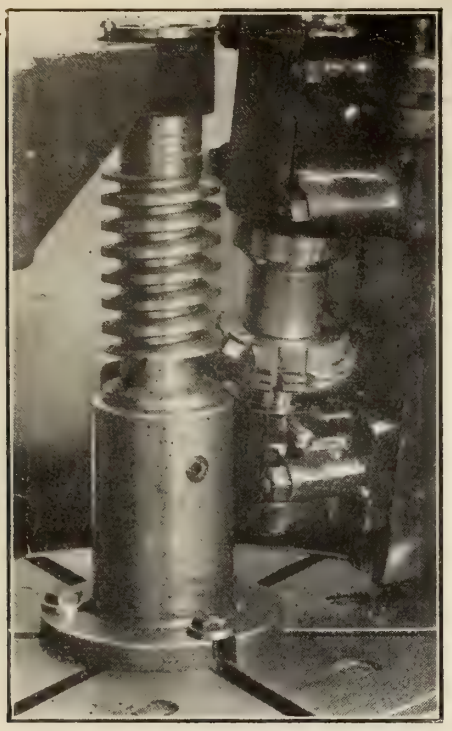


Fig. 2. — Finish threading low carbon steel worms.

any worm threading process are to the practical man, the outstanding features by which the merits of a given method are mainly judged. The production possible with the hobbing method is much greater than that which is possible with a lathe or disc cutter method. This is especially true of multiple thread worms, as the machine is geared for the number of teeth, just as in hobbing helical gears. This obviates the necessity of indexing by hand, and taking a fresh cut through the worm for each tooth, which must be done with a lathe tool or disc cutter.

The accuracy of worms produced by the hobbing method as outlined, is unquestioned. The reason being that in this system, the cutting action is progressive and continuous and produces accurately spaced multiple threaded worms which is an essential feature in efficient and successful worm drives. The cutting action is a result of the generating characteristics of the machine, and not dependent upon other devies which may be inaccurate or inaccurately operated. The amount of feed to the cutter and worm blank relatively to each other in an axial direction is dependent upon the helix angle of the worm. That is to say the greater the helix angle of the worm with the axis, the less the axial feed.

The hobbing method is also adaptable for roughing worms which are subsequently heat treated and then accurately ground. In roughing with this system the amount of metal remaining to be removed by grinding is uniform and also the spacing of teeth on worm is very accurate permitting a high degree of accuracy in the final grinding. The fixture for holding the worm blank should be of a very rigid design, with powerful means for driving, because the strains on this mechanism are severe.

Fig. 2 shows one of these hobs mounted in a gear generating machine finish threading low carbon steel worms, single threaded, 2.7in. pitch diameter, 0,666 linear pitch, with an output of 17 minutes each, floor to floor; while Fig. 3 shows the rough threading operation on an alloy steel seven threaded worm, 4.1 in. outside diameter, 4½ in. face, 1.-37 linear pitch. The time to thread this worm is 60 minutes, floor to floor. The teeth are, of course, ground to final size later. Another example of pro duction is the threading of alloy steel quadruple thread worms, 2.8in. outside diameter, 4½ in. face, 1.06 linear pitch in 8 minutes each, floor to floor.

MACHINE DESIGN

(Continued from Page 39)

The complete expression of the flexure formula for beams or structures subject to bending stress is

$$\frac{C}{S} = \frac{I}{M} = \frac{R}{E}$$

The last part of the formula was not obtained in Lesson 2[2] due to the fact that it is of less importance. In it E is the modulus of elasticity and R is the radius of curvature as given above.

We shall assume the complete formula for the proof in hand.

From the flexure formula $S = MC \div I$ where S is the stress at the extreme fibre on the concave side, and since $M = Py$ (load x deflection,) then $S = Py\ c \div I$ by substitution.

In Fig. 14 we have a distorted view of the deflected column, deflected at the middle by the amount y and arranged so that the deflected column becomes part of the circumference of a circle of radius R. In the figure there are two chords intersecting at right angles. The 35th proposition of the third book of Euclid states, that if two chords of a circle cut one another, the rectangle contained by the segments of the one shall be equal to the rectangle contained by the segments of the other.

$$\frac{l}{2} \times \frac{l}{2} = y(2R - y)$$

$$\text{or } \frac{l^2}{4} = y(2R - y)$$

$$= 2yR - y^2$$

$$= 2yR.$$

Approximately since the quantity y^2 is so small in comparison to 2yR as to be practically negligible, therefore

$$y = \frac{l^2}{8R}$$

Using the first and last ratios in the flexure formula, $S \div C = E \div R$ from which $R = E \div S\ C$; then after substitution in formula,

$$y = \frac{l^2}{8} \cdot \frac{S}{EC} = \frac{S}{8E} \cdot \frac{l^2}{C}$$

$$= \text{a constant} \times \frac{l^2}{C}$$

$$= K \frac{l^2}{C}$$

we have

$$y = \frac{l^2}{8R}$$

It is apparent that $S \div 8E$ is a constant since each term in it is a constant. Thus we have shown y to be equal to $k\ l^2 \div C$.

Merriman's Values of K to be used in Reakine's Formula

Material	Fixed Ends or Square Ends	Fixed and Rounded	Both Ends Rounded
Timber	1/3000	1.95/3000	4/3000
Cast Iron	1/5000	1.95/5000	4/5000
Wrot Iron	1/36000	1.95/36000	4/36000
Steel	1/25000	1.95/25000	4/25000

Table Showing Values of "K"

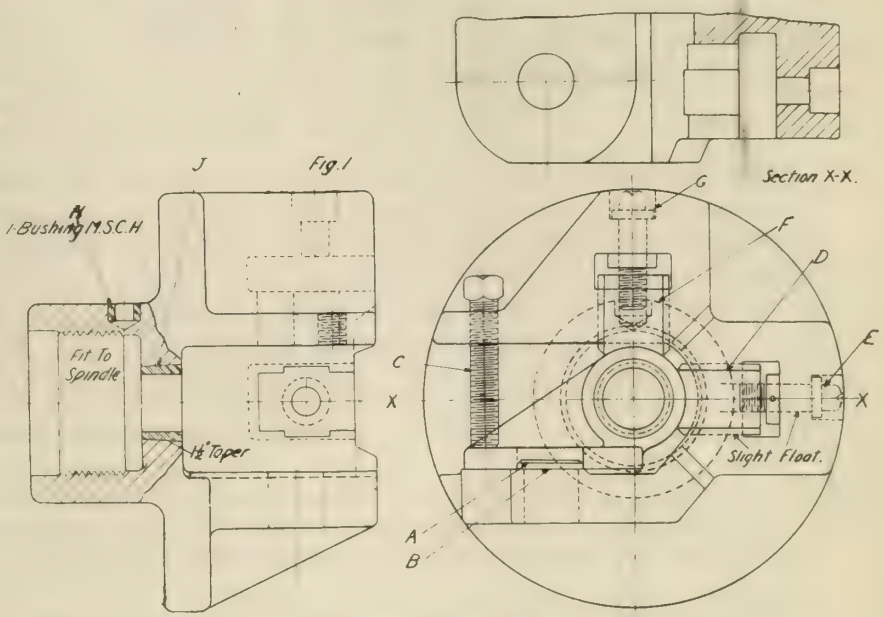
WHAT OUR READERS THINK AND DO

A NOVEL IDEA

By M. Srigley

Here is an idea that is to my mind novel, but well worth a trial. It has been developed by the workers in a machine shop in a small town in Ontario, and has been found to give satisfaction all around. The illustration shows the idea. Alongside of the regular time cards were placed what we termed "bank cards." One of these is shown in the cut. When a workman put in any overtime, he rang in the bank card instead of the regular one.

The foreman kept a bank book, as we called it, and in this book was entered the time spent by each worker on overtime in the week. When a man needed a day off through sickness, or had to take time off for any other purpose, the foreman was notified, and then the worker's regular card was rung in by the foreman himself, just as if the worker had been on the job. This amount of time was deducted from the bank book, and thus the men were assured of a more steady and regular income. Of course, we were allowed the added rate for overtime, and the deductions were made in proportion. During the winter and spring we put in considerable overtime, and thus the summer holidays were provided for.



It was not compulsory for the men to use the system, but was adopted by all, as it worked out so well. When an employee left, or was laid off, he was paid what was due him at the regular overtime rate.

SPINDLE NOSE FIXTURE FOR TURRET LATHE

In order to adapt the boring of the hole through the boss of the bracket illustrated in position at Fig. 1 to a turret lathe, it was necessary to build a special fixture which would enable the work to be located from a hole and surfaces previously machined. In machining this piece it is necessary that the two holes be very accurately spaced with relation to each other and consequently the fixture is built up with this in view. Referring to the illustration. The work is set over plug A with its finished bottom against surface B. In this position screw C is tightened just sufficient to hold the work in place, following with the slide D is advanced by means of screw E against the side of the boss, thereby squaring the work and partially clamping it at the same time. Following this, the slide F is caused to clamp on the upper side of the boss by means of screw G, and by completing the tightening of screw C, it will be evident the work is securely held in three places against the locating seat B of the fixture.

Sketch showing the type of fixture used.

The entire fixture is screwed on the spindle nose of the machine, a pin being used in bushing H for tightening purposes, while bushing J is used to guide the pilot of the boring tools, it being necessary to first rough bore the hole, followed by finish boring after which the hole is reamed. It will be noticed that this fixture has been made circular in shape and is so proportioned, or the weight so distributed, that it will be in running balance when the work is mounted in position, as otherwise the fixture would vibrate and produce poor work.

Have You Tried This Contest Yet? If not--- Do so Now

Below will be found twelve references to advertisements in this number. To the sender of the first correct set of answers to these we will forward one of these scales.
To win one is not difficult, and at the same time you will add to your store of knowledge. Read the details given below.

The scale is 6 in. long and is made from finest quality steel. One side is marked in 32nds, the other side in 64ths. A table of decimal equivalents is also stamped on one side, and a table of tap drill sizes on the reverse side. This scale is well worth securing.

What You Have to Do

We publish every week a number of interesting facts or statements selected from the advertising pages for that week. The selections for this issue are given below. Read these through, then turn to the advertising section and see if you can pick out the advertisements to which they refer. The work is interesting, it will train your powers of perception and of memory, it costs you nothing, it will make you better acquainted with the various lines of machinery and tools in the market, and with perseverance you are bound to win one of these useful scales as a prize.

Two readers, Geoffrey Ward and P. Lawson, both of Hamilton, Ont., submitted correct lists to the Oct. 27th issue. Quite a number of other readers had eleven answers correct, but not the twelve. G. Ward won out in the elimination test. Try again Mr. Lawson, and good luck to you.

CONTEST FOR NOVEMBER 17TH ISSUE

Contestants are required to write us, stating to which advertisements we refer in this number.

1—What to do in cold weather.
2—How to prevent being misled.
3—Something that is at your command and will prevent experimenting.
4—A case where the mixture is important.
5—How to meet traffic requirements.
6—A case where dirt cannot get in.
7—Something that finishes to any desired shape.
8—A case where a certain kind of bath is unnecessary.
9—Something that is instantly accessible.
10—Something that has unusual capacity.
11—A case where location does not count.
12—Something you owe to yourself.

These are Correct Answers for List from October 27th Issue

1—Northern Electric Co.
2—Wright Mfg. Co.
3—W. H. Banfield & Sons.
4—W. S. Rockwell Co.
5—United States Electric Tool Co.
6—J. T. Hepburn Ltd.
7—The Wallace Barnes Co.
8—Smooth-On Mfg. Co.
9—Dominion Steel Products Co.
10—Simons Canada Saw Co.
11—Algoma Steel Corporation.
12—Pratt & Whitney Co.

Closing Date for This Contest is December 8th.

DEVELOPMENTS IN SHOP EQUIPMENT

NEW TYPE WHEEL DRESSER

The Canadian Desmond-Stephan Mfg. Co., Ltd., Hamilton, Ont., have marketed a new type of grinding wheel dresser, which is to be known by the trade name of "Desmond-Hex." The principle feature of this dresser is that it provides a number of interchangeable bearings for the pin carrying the cutters. It is said that the chief weakness in the type of dresser formerly made, which carried the pin or spindle in hardened steel bushings mounted in the handle, was that the bushings eventually became loose through wear. Although the bushings were replaceable, the holes containing them usually became large, so that the handle itself had to be discarded.

The handle of the new dresser, however, is channeled on the inner sides of the head to hold removable, hardened, hexagon nuts having six holes drilled partially through each nut. The holes serve as bearings for each end of the spindle carrying the cutters, and each nut is held in place by a setscrew from the outside that fits a tapped hole in its centre. When the holes in which the spindle is running become worn, the nuts are removed by loosening these screws, and turning the hexagon so that the next pair of holes comes into use, the spindle being placed in them. In this way six pairs of bearings are available with each set of nuts and the nuts can be replaced when all the holes have become worn. The dressers are made in two sizes, the No 1 size taking the ordinary standard cutters 1½ in. in diameter, while the No. 2 size carries seven cutters 2⅜ in. in diameter, being intended for use on large and coarse wheels.

PROCESS TIMING INSTRUMENT

The Stromberg Electrical Co., of Chicago, Ill., have developed a very useful Process Timing and Signalling Instrument. It is primarily designed for manufacturing processes where the element of time is a factor, such as the heat treatment of coal, enamelling, plating, etc. Clockwork is eliminated and an electric motor provided in its place. A reducing train of gears is placed between the motor and the hands on the dial. The motor operates on either 110 or 220 volt circuits of any standard frequency. The dial is circular, 3½" in diameter, and graduated in several ways, according to the length of periods of time to be taken care of. In all cases, however, zero is where 12 is on a clock. In timing an operation, the red hand is moved through operating a "change" button and this hand is placed at any required point indicating on the dial a certain amount of time between it and zero. The indicating hand starts from the location of the red hand and moves toward zero in an anti-clockwise direction. Thus at any time during the process a glance at the instrument shows how much time must elapse before completion, by reading same directly from the dial. When the indicating hand reaches zero a fell signal or a light signal, or both, are operated and continue to operate, until the operator moves the indicating hand through the medium of the "set back" button, to its position coincident with the red hand. The current used in thus signalling the completion of a process can be also used to control air or steam valves or any other such mechanism as the process would require. When the indicating hand is returned to the starting point, namely, that of the position of the red hand, it remains there until set in motion by the use of the "start" button. The instrument is very rugged weighing about 9 pounds. It is 7 inches high, 5⅝ inches wide, and 5½ inches deep.

STAKING MACHINE

The H. C. Giles Corporation, of Rochester, N.Y., have recently perfected, and are now marketing, a machine for staking cupped or drilled rivets, studs, screws, and other small screw machine products. The machine is designed to be mounted on a bench or pedestal. The actual blow is caused through the medium of a treadle. The enclosed spring inside the frame of the machine and extending below and outside it, lifts the treadle, but springs on the side of the hammer provide an adjustment for the force of the blow. The spindle houses the hammer and the staking set. There is an arrangement by means of which the bar at the top of the machine acting as a hammer, is tripped, when the staking set has been brought to position.

Work can be quickly, neatly, and uniformly done on this machine. Adjustments taking care of a wide range of work are provided.

Should Play No Favorites

THE PRESENT controversy going on in the United States regarding the payment of tolls for the use of the Panama canal, deserves more than a passing mention. Briefly, the situation is this. There is a movement on foot to allow American vessels the free use of the canal, while of course the usual tolls would be collected from the vessels of every other country. From an American standpoint, this arrangement would be an ideal one, but the point must not be lost sight of that this question is an international one, and not a case where the whims of a few should settle the matter. Public opinion the world over is interested, therefore it behooves the Government at Washington to step cautiously.

Seven years ago, the United States admitted its treaty obligation to grant vessels of all countries the use of the canal, providing the same tolls were paid as on their own vessels passing through. This arrangement satisfied everbody, and should continue to do so. Luckily, the better class of American newspapers are not in accord with the new suggestion to eliminate tolls for American vessels and some of them in leading editorials ask the pertinent question "is America one of the countries who regard a treaty as a scrap of paper?" In baseball parlance, "this is a hot one," and should cause those who are fostering the new movement to pause for thought.

America must not repudiate its established international obligations, otherwise it will be placed on a par with another nation which laughed at a certain treaty some seven years ago.

Another suggestion is to leave the toll on American vessels, but to give them a subsidy which will in effect be a return to them of the money thus paid.

If such an arrangement came into effect America would more than likely become the laughing stock of the entire world. It would be no doubt generally discussed, that America, not wishing to break her treaty and her honor, found a new way to accomplish the same thing without losing that same honor(?) Surely the authorities will not allow either of these suggestions to go through, but will levy a toll on all vessels in a standardized way.

An Unexpected Result

AN ACCIDENT which resulted in the death of ten persons and a large amount of property damage was recently caused by the carelessness of a workman in taking a cover off a gasoline tank. This car contained a particular highly volatile type of gasoline, known as casing head gasoline. The gasoline is also known, according to the "Traveller's Standard" which describes the accident, as "wild" or "natural gas" gasoline.

The causes which led up to the disastrous effect seem to have been the omission of certain precautions, and the commission of grave errors. There is a safety valve on each gasoline tank car, which is supposed to lift at a pressure of 25 lb. per square inch, but which is also, according to regulations, supposed to be slacked off before the cover is taken off the dome of the tank, thus releasing all pressure that there may be inside. The workman who was detailed to unload the car first neglected to release this valve, and therefore the pressure, and secondly, on attempting to turn back the cover of the dome with a bar, and not succeeding, took a hammer and chisel to start the cover back. This practice is specifically forbidden by the regulations. When the dome cap was started, the gasoline being under pressure, forced some of the vapour through the cap, and a spark presumably from the chisel, ignited this vapour, with the disastrous result already mentioned.

It seems that no amount of warnings, regulations, or propaganda can ever imbue men with a sense of responsibility, or keep it alive in them day in and day out. It is probable that this man who was doing this was fully aware that he was breaking a regulation, and it is quite probable that he had done so before, and thought he could save a little time or a little trouble by disregarding it on this occasion. He not only lost his own life but caused the death of others, and huge damage besides. In most cases regulations are made for the purpose of protecting life and property, and are made after due consideration of their effects as regards retarding work. This loss of time is considered of less importance than the danger that would ensue if the regulation was not there. It seems to be inevitable however, that familiarity shall breed contempt in the minds of those who should be governed by these regulations, and sooner or later their contempt is visited by some calamity. This carelessness is not confined to any one industry, but can be found almost wherever men are engaged in occupations that carry a hazard of any kind. Even power plant men are not immune to this form of carelessness, and it is not unusual to find guards around eccentrics or crank webs removed for some repair, and never replaced. It is not unknown either for electric station operators to be killed by working in narrow places on live wires which could have been switched off with a little expenditure of time or trouble. The remarkable part of the whole thing is that men who would ordinarily kick loud and long if ordered to do any dangerous thing, will of their own free will break regulations made to safeguard them, for the sake of saving themselves a moment's inconvenience.

MARKET DEVELOPMENTS

Not Much Activity Showing on Various Markets

With Exception of Large Steel Order and Railway Car Repair Work in Montreal District, Business is Very Quiet—Machine Tools are Dull and Scrap is Practically Stagnant

THE BRIGHT spot in this week's market is the placing of an order for 4,300 tons of steel. This material is to be used in the construction of the new Mount Royal Hotel in Montreal. Next in importance is the announcement that the Canadian Car & Foundry have received an order from the Canadian National Railways to repair one thousand cars. Both these orders mean quite a bit to the Montreal district at the present time.

Our Montreal correspondent says that machine tool manufacturers are announcing improvements in the design of their tools, and that conditions are improved somewhat, because salesmen can now get a hearing, where previously such was not possible. This information is cheering in itself, although the actual amount of business closed is not so comforting.

Toronto machine tool dealers say that the small demand for machines in October has dwindled away to almost nothing this month, and that they cannot see any improvement in sight until business generally picks up. Price seems to be tight, feeling the time is bound to come before long.

a minor consideration in the purchasing of such tools. Even the small tool market shows a decrease this month.

Our Pittsburgh correspondent tells us that the production of steel ingots in October was at the rate of 23,000,000 gross tons a year, or about 44 per cent. of productive capacity. This rate is about one third greater than the rate in September, or more than double the rate in July.

He also says that there is almost complete stagnation in large construction work, like hotel and office skyscrapers, bridges, factories and power plants, and that most of the building activity is confined to garage and dwelling house construction. Such building is occurring becauses the owners want the facilities right away.

The pig iron market is very quiet, and prices remain the same. Coke prices are softer, as ovens have been blown in too rapidly in proportion to increasing consumption. In the past few weeks some merchant ovens have been going out.

The scrap metal market is as poor as ever and from present outlook is likely to stay in that condition.

Railroads Are Not Buying—Some Lines Active—Others Are Stagnant

PITTSBURGH, November 17th.—Production of steel ingots in October was at the rate of about 23,000,000 gross tons a year, equal to about 44 per cent. of productive capacity, which may be estimated at 52,500,000 tons. The rate of production in October was one-third greater than the rate in September, and was more than double the rate in July.

Steel production is now in harmony with the condition of business generally, that is, there is as much steel production as one would expect there to be when conditions generally are, as they are. There is neither more production nor less production than one would expect. From April to August inclusive the condition was different. Steel production was far below the rate one would expect considering the amount and character of the business the country was doing. That was because the country was running in part on stocks of steel. A corollary to this is that there has been little increase in the actual consumption of steel since July. The difference is that what is needed has to be made by the mills from day to day.

Despite the great increase since July, steel production is at a low rate compared either with productive capacity or with production in recent years. Probably the most common view is that this is because "business is bad" but business is not really bad all along the line. Some lines of business are quite active, some are stagnant. As to steel consumption, there is absolute stagnation as to railroad consumption of steel and there is almost complete stagnation in large construction work, like hotel and office skyscrapers, bridges, factories and power plants. There is by no means stagnation in "building" generally, for there is a great deal of activity in garage and dwelling house construction. Such building occurs because the owners want the facilities right away. They are getting older day by day and do not want to wait for lower costs. They would save money but lose time. Investors, on the other hand, consider simply the money and they are waiting for lower costs. As to the railroads, everyone knows that they cannot spend money on steel now, one sufficient reason being that they have not the money.

A simple proof that the general line consumption of steel is heavy can be furnished; general line consumption involving machinery, hardware, tools, implements and a wide variety of things, railroad consumption and consumption in large construction projects being light. In 1906 there was heavy demand for steel by all lines of consumption. The mills ran at full capacity throughout the year and produced 22,600,000 tons of ingots, just a trifle under the rate of production shown for last month. In 1906 there were 5,623 miles of new railroad built in the United States, besides many miles of secondary track, and in the United States and Canada there were built 243,670 freight cars and 6,952 locomotives. There were many skyscrapers erected, also power plants, bridges, factories, etc. Of these things there is now very little, yet the total production of steel is a shade greater, hence the consumption in other lines has greatly increased, in a proportion somewhere between 50 and 100 per cent. Population has increased about 23 per cent. since 1906. Precisely where the steel is going now no one can say, simply because it is being so widely dis-

tributed both geographically and by lines of consumption.

Production is hardly likely to increase in the next couple months over the October rate. Consumption usually decreases a little in the winter months. The steel market has been quieter since the middle of October, and this will probably be reflected in somewhat lighter production, but there is no decrease observed thus far.

Steel Prices

The steel price situation is a simple one. There is merely a slight sagging tendency, whereby, to illustrate, one is likely to be able to place a given order now at say a dollar a ton less than he would have to pay on precisely the same order two or three weeks ago, while two or three weeks hence a mill may be willing to concede a dollar more in the price than it would today. There are no clear cut declines, one reason being that in most lines there are no clear cut market prices, a quotation being made on each order according to its desirability to the mill at the time.

Roughly speaking, bars, shapes and plates are between 1.50c and 1.65c depending on circumstances. Regular prices on sheets are 3.00c for black and 4.00c for galvanized, while these prices are being shaded by a number of mills, generally $1 to $3 a ton but possibly $5 in extreme cases. The lists of September 16 on tubular goods are being observed by some mills while others are making slight concessions. These concessions have hardly increased in extreme amount in the past week or two, but they have become more common, applying to a larger number of orders.

The financial reports of steed companies lately have shown that steel can be made at somewhat lower costs than was assumed. The reports differ widely, the differences evidently being due to some producers having made their adjustments, in inventory, etc., some time ago, while others have had to write off large sums in the September quarter, thus producing losses. There is room for prices to taper off a trifle more, with fundamental items of cost remaining as they are, while with the lower freight rates so commonly expected, but which may be long deferred, there would be room for a little more downward readjustment. Mills will hardly make their final concessions until the time comes when they see buyers are ready to take hold freely, making contracts for the future and being ready to stock up in a moderate way. Stocks now are down to almost nothing, being below what they should be for normal conduct of business.

The freight ton-mileage of the railroads in August has just been reported. It shows a quantity 29 per cent. under that in August, 1920, which was the record high month in the whole history of the railroads. The ton-mileage in the eight months ending with August was 22 per cent. under that in the same months of 1920, and 1920 as a whole was the record year in ton-mileage. The ton-mileage statistics are not consulted as much as they should be. These figures show there is not a great deal in the argument that the railroads must reduce freight rates for their own good, so as to get more business. The rate reduction is needed to stimulate general business, rather than to help the railroads. The figures also show, however, that business in general has not been nearly as slack as has been commonly assumed.

POINTS IN WEEK'S MARKETING NOTES

The production of steel ingots in October, according to Pittsburgh reports, was about equal to 44 per cent. of productive capacity.

A great deal of activity is going on in garage and dwelling house construction, but not much in railroad work, large hotel work, bridges, office, skyscrapers, etc.

Pittsburgh states that bars, shapes and plates are between $1.50 and $1.65 depending on circumstances. Regular prices on sheets are 3c, for black and 4c, for galvanized, but these prices are being shaded by a number of mills, generally $1 to $3 a ton, and in some extreme cases $5.

The Toronto market is very dull this week. Even the small tool dealers are disappointed at the volume of business coming in. Up until this month small tools were moving fairly steady, and better things were expected, but instead of becoming better, business has tapered off.

A large structural steel deal went through this week in Montreal, some 4,300 tons of steel being ordered. An order to repair 1,000 railway cars also went through in this district.

Montreal reports no change in price in the pig iron market. Business has been very quiet, and no increase in demand is expected. Foundries asking for quotations on pig iron, are still asking to be protected apainst declining freight rates.

Business in machine tools shows no improvement. Improvements in design are being made, this resulting in considerable interest. It shows that manufacturers are watching the market carefully.

The scrap metal market is just as dull as ever, and dealers do not look for any improvement until foundries generally are able to secure orders.

The pig iron markets are all very quiet. Prices are not quotably changed, but large inquiries might easily bring out somewhat lower figures. The local market remains at $20 for Bessemer, $19 for basic and $21 for foundry, f.o.b. valley furnaces, freight to Pittsburgh being $1.96.

Connellesville coke is softer, owing to ovens having been blown in too rapidly in proportion to increasing consumption, and in the past week or two some merchant ovens have been going out. Spot furnace coke is $3.25 as an asking price, and shading would extend to 15 cents, perhaps 25 cents. A fortnight ago $3.25 was the minimum. Spot foundry coke is still quotable at $4.25 to $4.75, but even the best brands sell poorly at $4.75 and probably some fairly good coke could be picked up at under $4.25.

TORONTO MARKET IS VERY QUIET

TORONTO, Nov. 17th—There is a story now going the rounds which defines in a peculiar manner the difference between an optimist and a pessimist. It says "that an optimist is a man who sees a light afar off, which isn't there, and that a pessimist is a man that comes along and blows out said light." If such a condition were possible, it would be safe to say that the majority of dealers on the Toronto market this week, had their cheeks all puffed up ready to blow out the light which isn't even there.

When asked how the market was going, so far as machine tools were concerned, one dealer replied "that there wasn't any such animal." To prove his point he told of how he had offered a grouping of first class tools at what he figured were ridiculously low prices in order to get them out of stock. In spite of the sacrifice he was making, the prospect laughingly offered him about one-half of what he had asked. Needless to say the tools did not change hands, and according to this dealer, he is through trying to sell on a price basis. Price is a secondary matter alongside of the fact that unless a manufacturer actually needs the tool, he will not buy at any old price. If one were to group all the business closed locally in machine tool circles since the first of the month, the total would not be imposing. In fact dealers frankly admit that September was a much better month than October has proved to be so far.

A certain salesman of tool steel turned in a splendid sales record for September. Naturally he was uplifted, and so was his firm, and for good reason. It was the best month he had turned in during 1921. Full of enthusiasm he started out this month feeling the turn had been reached, but up to present date he has not closed enough business to even pay his expenses. The disappointment he is showing is a good sample of how the average dealer in any line of the metal market is feeling. They had all expected things to be better, and the spurt of September added to that belief, but unfortunately this spurt has not lasted, with the result that the first half of October can be said to have been a very poor fortnight.

The Steel Market

To ask a dealer on the steel market, how business is progressing, is courting trouble. Like as not he'll bite your head off with the remark "Horrible." Apart from sheets the demand is very

light, and even these are tapering off considerably. On our quotation sheet this week we quote $3.25 per 100 lbs. for both iron and steel bars. This may cause a roar from some quarters as $3.50 is supposed to be the regular price, but as about 75 per cent. of the business is being closed at the lower figure, $3.25 seems to be the correct one to quote.

About the worst member of all, is the scrap market. The amount of business being closed is practically nil, and as long as foundries keep working spasmodically, this condition is likely to continue.

Although frankly disappointed, the dealers in the various lines are not despairing. They feel that before long conditions will improve, but just when this will take place is another question, and one which very few care to offer a prophecy on. A few courageous dealers say that after the elections are cleared away things will be better, but when questioned closely they admit that this is only their opinion and they have nothing concrete to back it up. One dealer, when asked his opinion of the near future, remarked that he would leave it to others to prophesy, but in the meantime he'd bust a button if necessary in order to secure business. It would seem as if the present condition will exist for at least the balance of the present month, if not until the end of the year.

Large Steel Order is Placed Thousand Cars to be Repaired

MONTREAL, Nov. 17th:—The outstanding event in the past week was the placing of the order with the Dominion Bridge Co., for the 4,300 tons of steel to be used in the construction of the new Mount Royal Hotel in this city. After a period of time, during which business has been at a very low ebb, this order has created a great deal of interest. The order for the cut stone for the same building was also placed this week. In addition, the Canadian Car & Foundry announce that they have received an order from the Canadian National Railways for the repairing of one thousand cars. It is understood that five hundred of these will handled at the Montreal plant, and the balance at the Amherst, N.S., plant. Generally speaking, trade in sheet plates, and other lines, is feeling the usual increase of business just prior to the close of navigation. Business locally has not shown any improvement over that of the last few weeks. The small volume moving is still much better than that of the low point in July and August. The stocks carried by most jobbers are rather small and there appears to be no attempt at increasing these before business shows a much better tone than that exhibited at present.

Steel Market

Sheets have been moving a little better this week owing to the approaching close of navigation. The increase has been occasioned by trade coming from points outside the city. Local business is much the same. Although local jobbers have been stating for some time past that the next revision in base prices of steel would be upward, this last week they have announced prices that are about ¼ of a cent per pound less than that prevailing for some time. These prices apply to both iron and steel bars, base, Montreal. There has been but little demand for either iron or steel bars for some time, and this reduction is considered the limit to which the manufacturer will go to try to induce the consumer to place business. With the exception of the Mount Royal hotel order there has been a very quiet time lately in structural steel. It is not expected that there will be much activity till the business for 1922 comes up for consideration. Everything points to a very large year in building next season.

Pig Iron

No change in price has been made in the last week. Business has been rather quiet and no changes are expected either in the demand, or prices. Foundries asking for quotations on pig are still asking to be protected against declining freight rates. This end of the pig iron business involves a little speculaton. Producers of the iron usually have sold f.o.b. furnaces, freight allowed to destination, and have been in the habit, in the past, of absorbing any declines in freight rates as a legitimate profit, and on the other hand they have had to stand any increases in freight. Thus they do not look with favor on protecting the consumer against such a decline. They do not care to contract for iron for any great length of time at present prices. There is every reason to believe that when pig iron becomes more active, there will be another upward revision in price. Forecasts for the 1922 season are being made, and from all reports the foundries will be doing a far greater volume of business, when next year's business opens up.

Machine Tools

Business for the last week has not shown any improvement in the machine tool line. From time to time manufacturers are announcing improvements in design, or the introduction of a new line of machine tools. All these are being gladly received by the shops, and the merits of the various offerings are investigated, but few orders are materializing. All this is an improvement over the condition existing a few months ago when a machine tool salesman could not get a hearing. Now he can not only get a hearing but he often receives inquiries. This shows the machine shop men are watching the market carefully and are much nearer the buying point than they have been for some time. It is doubtful though, if there will be much buying of machine tools before there is a real improvement in general business conditions. The announcement of several machine tool builders of international repute to sell their product at cost, is not looked upon as of any real importance as manufacturers do not want additional equipment at any price.

Small Tools and Supplies

This department of the iron and metal markets keeps to the even tenor of its way and leads all departments in stability. No great change in volume has been noted for several weeks. Prices have not undergone any radical changes but appear to have reached their normal level. Manufacturer and jobber are doing business along the accepted conventional lines and the price list, which was for a time discarded, is now an important factor in all negotiations Withal, buying is only a stage or two removed from the hand to mouth methods.

Very litle activity has been noticed on the non-ferrous metals for the past week. Usually these metals have very active price lists and quite often they are coupled up with speculative interests, but for the past two weeks they have been abnormally quiet. Copper prices have been pretty steady for some time. Tin is down slightly. No immediate changes are looked for at present but the market may develop into an active one on short notice.

Another week of little or no trading has to be noted on the scrap metal market. From all quarters comes the same report that foundries cannot see their way clear to take on a stock of scrap iron. Non-ferrous metal scrap is also very dull indeed. The brass foundries appear to be quite as dull as the cast iron shops but reports that foundries generally will be doing a largely increased business in the early part of the new year has had the effect of giving scrap iron dealers something to look forward to, which will be a lot better than the future they have been facing for the last few months.

The annual meeting of the Canadian National Newspapers and Periodicals Association, took place in Toronto on Nov. 10 and 11, and many interesting papers were presented. On Nov. 10, a luncheon was held at the King Edward Hotel, at which many prominent speakers took part including the new Lieut. Govenor General for Ontario. His message to the business and technical papers of the country was especially inspiring. He pointed out that Canada was passing through a very critical period, and that is was up to the editors of the various business, religious, technical and kindred journals to lead, and lead carefully. The power of such periodicals was pointed out, and his Honor concluded by saying that he felt Canada would come through with great success as we had as our backbone a wonderful country in itself.

SELECTED MARKET QUOTATIONS

Being a record of prices current on raw and finished material entering into the manufacture of mechanical and general engineering products.

PIG IRON

INDUSTRIAL NEWS

The Malcolm furniture factories, Listowel, Ont., are in full swing.

A. L. Clarke, patent leather manufacturers of Toronto, are installing a new boiler.

The Toronto Saw and Tool Co., has been incorporated in Toronto with $400,000 capital stock.

Thos. W. Hayes & Co., Montreal, has been incorporated with $50,000 capital stock.

The Master Tires, Ltd., Toronto, has been incorporated to manufacture automobile tires with $1,000,000 capital stock.

Giles, Rice & Peters, Ltd., Toronto, Ont., has been incorporated to manufacture automobiles, etc., with $100,000 capital stock.

The Ottawa Metal Products, Ltd., Ottawa, Ontario has been incorporated to manufacture metal products, etc., with $300,000 capital.

The Public Utilities Commission, Galt, Ontario, has awarded a contract for 1600 ⅝ of one inch water meters to the Neptune Meter Co., Limited, Toronto.

The Williams Engineering Co., Ltd., Winnipeg, has been incorporated with a Dominion charter and the capitalization of $50,000.

The Consumers Metal Co., of Lachine, Que., was sold on Nov. 9. by Chartrand & Turgeon, liquidators, Montreal, to the Bankers Trust Company of that city.

The City Council of Toronto, Ont., is considering the temporary heating of the new livestock arena, to be part of the permanent heating at a cost of $28,000.

The Parish and Heinbecker Company of Winnipeg is reported to have purchased water frontage in Port Arthur with the intention of building a grain elevator.

The Multiple Co., Toronto, Ontario has been granted a license to manufacture stamp affixing machines, wire fencing machines, machinery tools, etc., with $10,000 capital stock.

The American Bed and Spring Co., Toronto, has been incorporated to manufacture beds, springs, articles in which iron, steel, wood, metal, etc., are used. $40,000 capital stock is the rating.

Some seventy manufacturers had their products on display at the Made-in-Galt exhibition this week. This is Galt's first venture in this line and results were gratifying.

The foundry owned by the Chicoutimi Pulp Co., Chicoutimi, Quebec, was recently damaged by fire with a loss of $50,000. It is expected that the owners will rebuild.

Mr. Parker, sales manager of the Burke Machine Co., Conneaut, Ohio, says that his company closed twice as much business in October as they did in September.

Mr. E. L. Curzon advertising manager of Darling Bros., Montreal, will leave that position at the end of the present year to occupy a similar one with Tooke Bros., Ltd., Montreal.

The Buffalo Specialty Co., Bridgeport, Ont., manufacturers of Liquid Veneer, plan to rebuild its plant which was destroyed by fire. The estimate of loss is $75,000.

The city architect of Toronto has issued to the Auto Service Syndicate a permit to alter a factory into a garage and instal gasoline equipment at the southwest corner of Dundas and Victoria streets at a cost of $40,000.

Fire losses in Canada during the week ending October 26th, are estimated at $443,800, compared with $509,750 the previous week.

A strong protest against a proposed wage cut is made by the miners of district 26 united mine workers. The Wage cut goes into effect November 30th, when what is known as the Montreal agreement expires.

The finance committee of the city council of Kitchener, Ont., decided to submit to the council a proposal for the erection of a new city hall at an estimated cost of $250,000.

It is learned that large quantities of Canadian wheat estimated at 2,000,000 bushels have been purchased by the Government of Greece. On account of financing difficulties the buying is done through New York Houses.

Authority for the construction of a $500,000 plant has been given to the Three Rivers Pulp & Paper Co., Three Rivers, Quebec, by the Municipal Council. The erection of this plant will be commenced this year.

The Mona Petroleum Products, Ltd., Toronto, which has been incorporated with a capital stock of $500,000, will soon start the erection of a plant at Trenton, Ontario, a sixty acre site having been secured.

Permits have been issued for the erection of the Notre Dame Hospital, Montreal, a seven storey building to cost $500,000. An office building is also to be erected for Crane Limited, Beaver Hall Hill to cost $220,000.

Tenders amounting to $13,000 for an additional machine shop at the Central Technical School, Toronto, has been passed. The new equipment includes 21 lathes, one drill, a hacksaw, a grinder, 12 motors and various kinds of tools.

Canadian Crucible Alloys, Limited, Fraser, Ont., have their steel plant perfected to such an extent as to be able to take off tests from the Canadian ores from which they plan to produce high speed steels.

A meeting was held in Toronto on November 15th, by the various manufacturers interested in the proposed new machinery hall for exhibit purposes at the Toronto Exhibition. We will give further particulars of this meeting in our next issue.

Langley & Austin, brass, bronze and aluminum founders, Galt, report some improvement during the past ten days. This applies particularly to the demand for trolley wheels, bushings and gears, the latter indicating a better feeling in rubber goods manufacture in that locality.

The village of Lyndhurst in the vicinity of Brockville, Ont., is proposing to erect a High School to replace that recently destroyed by fire in the neighboring village of Athens.

It is expected that the total expenditure on good roads in the Province of Ontario will amount to $25,000,000. A large part of this amount will be carried by the Provincial Treasury. These figures have been quoted by the Department of Highways.

A. B. Jardine Co., Hespeler, reports improved demand for pipe threaders and small tools. While this improvement, they state, apears to be spasmodic, the fact that orders are coming in for stock purposes indicates a slightly more optimistic outlook among jobbers.

The Ontario Show Case Co., 321 King St., Toronto, Ont., has awarded contracts for a factory to cost $50,000.

2,066,400 tons of Gold ore are being put through reduction plants in the gold mines within the province of Ontario, per annum. The monetary value of the production per month amounts to approximately $1,584,000. This means a production at the rate of about $19,800,000 per year.

Ontario Potteries, Ltd., Bowmanville, Ont., will erect a pottery plant at the cost of $50,000.

Buchanan & Hall of Yale, B.C., are erecting a sawmill at Choate, B.C., at the cost of $10,000.

The Bowmanville Foundry Co., state that they find business very much improved, and still improving. At present they are running 55 hands.

A new plant for the Rawley Drug Co., will be erected on Dundas St., London, Ontario, construction commencing about the first of the new year.

The Lumber Mill of the Canada Lumber and Timber Co., Vancouver, B.C., was recently destroyed by fire with a loss of $100,000.

Business is so brisk at the plant of the Langslow Co., Cobourg, Ont., that it is necessary for a night shift to work several hours.

The newest freighter of the Canadian Government Merchant Marine, The Canadian Britisher, will leave for Vancouver on Saturday, November, 12th. On her trial trip recently she proved most satisfactory.

Knitting mills in Listowel find difficulty in securing sufficient girls. The mills are turning out between $25,000 and $30,000 worth of goods monthly, despite reduction in price to about half that paid for the product a year ago.

An extensive deposit of high grade Asbestos has been located on the main line of the Canadian Pacific Railway, near Kamloops, B.C. Provincial Government engineers are now examining the deposit.

The opening of the New Bacistan Bridge, which was the last link in the Montreal-Quebec highway took place recently. The bridge is 1,219 ft. in length, of new construction, and cost about $200,000 to construct.

Mr. Grant Hall of Montreal, vice president of the C.P.R. was in London, Ont., quite recently. While there he stated that business conditions in Canada are now better than for a long time and will continue to improve. He is looking for a big increase in freight traffic shortly.

The Sterling Motor Truck Co.; The Wisconsin Corporation, have been licensed to manufacture automobiles, etc. in Ontario with a capital stock of $40,000. Mr. Frank E. Brown of Toronto, Ont., has been appointed to represent the company here.

Thorold, Ont., has obtained a new industry, known as Thorold Motors Limited. Work will be commenced very shortly on the erection of the plant. High grade motor-propelled vehicles will be made. The company is composed largely of local men.

The Main Belting Co., of Canada, Montreal, announce that their new factory has recently been opened in Montreal. The new plant will be utilized for the manufacture of their special lines of belting which has been sold in Canada for the last ten years.

The Lewis Engineering Co., Toronto, Ont., has been incorporated at $500,000 to acquire from the Lewis Crest Appliance Co., Chicago, Ill., the benefit of certain Canadian patents for improvements in making appliances for locomotives, etc., and to manufacture and assemble equipment, machinery, etc.

The National Sanitorium Association of which Mr. E. L. Ruddy, 372 Spadina Avenue, Toronto is chairman, will soon award the contract for a three storey hospital to be erected at Gravenhurst, Ontario, including a steam and mechanical ventilation system. About $600,000 will be the cost.

According to information received from London, England, Canadian Products are to be given first consideration in awarding contracts. Mr. F. C. Wade, British Columbia Agent-General in London, England, says:—"I am all for cementing the Empire, but I do not see any reason why we should not specify 'Canadian cement'."

The location at Walkerville, Ont., of a new million dollar company operating under a Provincial Charter and known as Colonial Motors, Ltd., is arousing much interest in the Auto trade. The company plans to commence operations as soon as possible and may purchase the factory of the Canadian-Detroit Lubrication Company in order to facilitate production.

The Douglas Packing Co., Cobourg, Ont., is very busy at the present time filling orders and is experiencing a great revival of activities. About 26 cars of apples are dsposed of weekly. Owing to the destruction by fire of their plant at Rochester, N.Y., the local plant is filling many United States orders. It is expected that business will be brisk for some time.

The total amount of contracts awarded for construction in the Dominion of Canada for the month of October 1921 totalled to $18,997,200. Of this item $1,616,600 was spent for the erection of factories only. This of course does not take in stores or warehouses. The totoal of contemplated new construction work in Canada for the month of October, 1921 amounted to $19,651,100.

Negotiations have been completed for the purchase outright by the London Concrete Machinery Co., of London Ontario, of the business of the Ideal Concrete Machinery Co. of Windsor. This is the Canadian branch of one of the largest concerns in the United States. The plant will be removed to London and it has not yet been decided whether the business will be operated independently or in connection with the London firms factory.

The International Wheel and Rim Co., have just been granted a charter to manufacture double-disc steel automobile wheels. The company has decided to locate its factory in Toronto but have not as yet picked out a permanent site. An option has already been secured on temporary manufacturing quarters. It is intended to make Toronto the headquarters for its export business, and it is the recent acquisition of the Durant Plant that made them decide to locate in Toronto.

The Jenssen Engineering Products Co. Montreal, have taken over the business of the plant, and of the Power Equipment and Supply Co. The new company will analyze industrial problems, make recommendations and supply materials, machinery, equipment, building, etc.

Reports from Vancouver, B. C. state that shipments of lumber to the Orient from there this year have been heavy. It is estimated that Japan has taken some 200,000,000 feet of lumber from British Columbia and the Pacific coast states, as against a total importation of 66,000,000 feet for the whole of 1920, and 12,000,000 to 14,000,000 in a normal year.

There are other industries looking to London with a view to locating there. In this connection it is pointed out that with two large motor truck factories and a large automobile industry there, it will be a good chance for establishing factories to manufacture automobile and motor truck parts. The Service Truck Co., are considering the erection of a factory upon the site which has been purchased on the Wellington road, London. Construction operations will commence early in the New Year.

Negotiations for the location of another new factory at Brockville, Ont., were completed quite recently with the signing of agreements between J. R. Baxter Co., Montreal, and J. Amos Johnston Industrial Commissioner of Brockville, for the immediate erection of a Grinding Wheel Factory, 200 ft. by 50 ft. to be built at an approximate cost of $24,000. The erection of this factory will be commenced immediately and every effort will be made to have the plant in operation before the new year.

Mr. J. S. Nicholson of Manchester, England, a member of the Nicholson Rain Coat Co., of Manchester and London, England, is in Toronto after a business tour of the Canadian West. He had not been in Canada since before the war, but states he is frankly astonished to find trade in this country in such an excellent condition. He says that business in England is picking up, but there is far more business in this country in relation to population than there is in England.

In leaflet 3665, just issued by the Westinghouse Electric & Mfg., Co., motors for elevator service are discussed and illustrated. It is shown how satisfactory elevator service may be obtained. Further, it points out how to select the elevator motor, for which purpose several formulae are given. Type LC crane safety switches are illustrated on a small blotter (No. 57) for vest pockets, which is being distributed by the same company. Insure against loss by stocking renewal parts is the theme of blotter No. 56 which has also been printed by this concern.

Plans of the Ontario Hydro-Electric Commission for the deepening of the St. Lawrence was presented at a meeting of the International Joint Commission on November 14th in Ottawa.

The N. B. Pritchard manufacturing plant at Sherbrooke, Ontario, owned by the Dominion Metal Co., is to be enlarged and new equipment installed. Plans are now under way for the erection of a three story building. In addition to their regular line the company intend to manufacture high temperature fire cement, etc.

The number of manufacturers who are in the backwoods these days, would seem to indicate a marked demand for long-distance boring machines in these quarters. That so many of them are reporting good business in the frozen north, speaks well for their lessons in high speed during the war.

Armstrong Whitworth & Co., England, is said to have been awarded the contract for one of the new Super Dreadnoughts ordered by the English admiralty at a cost of £7,500,000 Sterling. It is estimated that it will require three years and the services of 500 men to complete the vessel. The Canadian office of this company is situated in Montreal, Quebec.

Greenshields, of Montreal, have purchased the merchandise of Gault Bros. This is one of the most important sales of dry goods stocks ever recorded in Canada, the purchase price being one million dollars. In discussing the purchase yesterday, Mr. Cains said that of late the firm had been experiencing a steady improvement in business throughout Canada, sales increasing and collections being satisfactory. Indications he said pointed to the largest turnover in the history of the company.

The Vanadium-Alloys Steel Co., Latrobe, Pa., have issued a handy reference card, giving a number of practical points to the tool hardener. The size of this chart is 8½ in. x 11 in., and it is made of heavy cardboard, provided with a cord for hanging on the wall of the hardening room or the tool room. On one side are printed 37 tips, and on the other are shown the various grades of tool steel made by the company. The card is entitled "Tips for the Tool Hardener. Suggestions of a Practical Man of Long Experience."

The contract for the structural steel to be used in the new United Hotels Co., Mount Royal Hotel at Montreal has been let to the Dominion Bridge Co. The total tonnage used will be 4,300 tons. Details and drawings have been practically completed and the work is now under way. The start on the erection of steel will be made not later than January 1st. The steel work will be completed before the end of March. The contract for the cut stone for this same building was also awarded during the week, to the Canadian Benedict Stone Co., which firm has a plant at Maisonneuve, P. Q. Competitive bids from companies proposing to furnish Indiana stone were received, but the local firm managed to present the better proposition and secure the order.

The Davis Bournonville Co., Jersey City, N. J., has placed on the market a welding torch and carrying case outfit, which is especially adaptable for garage and machine shop use. The outfit is portable and consists of a torch, three extension tubes, five welding tips, one decarbonizing tube, one oxygen regulator, one actylene regulator, some hose for both regulators with suitable connections, a spark-lighter, a torch wrench, also a regulator wrench.

This outfit is not intended as a makeshift or emergency outfit, but is capable of handling any welding job regardless of size or conditions. The chief feature is its portability. In the literature describing this new product, instruction is given as to its uses.

Mr. W. M. McRobert, president and sales manager of the Canada Stoker Co., Ltd., states that their business this year can be designated as a good average year. Last year's business was above the average, this year's slightly below 1920. They attribute their success to persistent advertising and aggressive salesmanship. They have extended their business to the U.S. and find that they can manufacture their stokers in Canada and sell in the U.S. at less cost than they can have their product manufactured in U.S. This, in spite of the fact that there is a substantial duty on stokers imported into the U.S. also freight and other charges. Mr. McRobert considers the outlook for business as promising and expects that conditions will become more settled after the election. At present, there is more activity in the textile industry than in any other field.

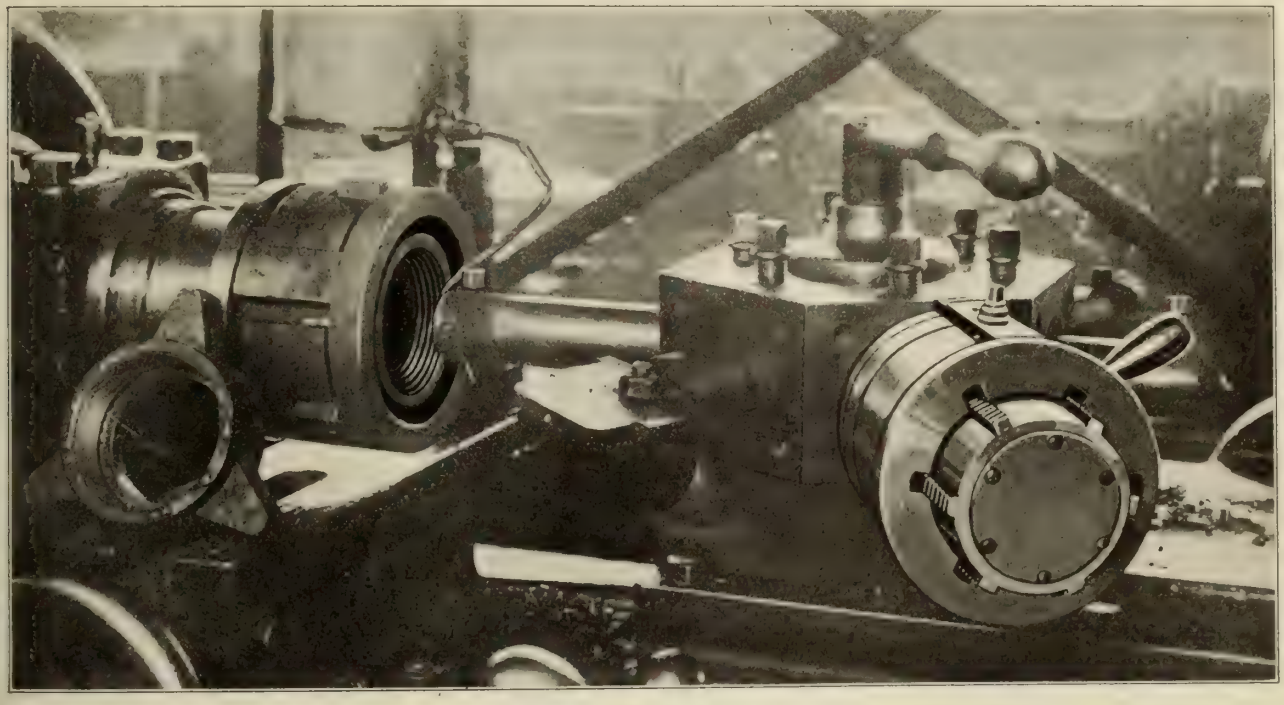
Something like the public spirit that is going to assist in solving the problems of unemployment, is manifested by William J. Connors, proprietor of the Buffalo Courier. He has leased the East Buffalo car shops of the New York Central Railroad, and intends employing from 1500 to 2000 men in the work of repairing railroad cars. The plant is one of the largest and most modern in the United States and has been idle for eight months. Mr. Connors, outlining his plans, states: "I intend to make the wheels of industry hum in the section of the city where the car shops are located. Business will be helped by this and not only East Buffalo, but the whole city will benefit." The East Buffalo railroad yards are full of cars awaiting repairs. Only the most essential repairs on such cars as have been required by the traffic have been made for the railroads.

The John Watson Company, Ayr, Ont., manufacturers of barrows, factory trucks and certain lines of agricultural implements, are steadily recovering from the effects of the disastrous fire of eighteen months ago, when their main building was wiped out. A new factory of about 50,000 square feet is nearing completion. They are now operating in a small building 50 x 60 feet, and are badly handicapped by narrow quarters. Their foundry and blacksmith shop escaped the flames. The Watson Company had its origin some seventy-three years ago, as manufacturers of stoves. These were sold, at that time, by wagon from house to house, and very often the man who actually made the stoves, was also the salesman on the road. Agricultural implements were then added and, latterly, they specialized in light factory trucks but retaining certain types of farm machinery.

Garfield Hood, who for some years has been connected with The Steel Company of Canada, Ltd., latterly at the Swansea office of the company in Toronto, is severing his connection with this firm at the end of November to become sales manager of the Ontario Steel Products Company with headquarters in Gananoque, Ontario. This is a newly created position with the latter company.

Mr. Hood's identification with The Steel Company of Canada extends over a period of seventeen years, part of which time was spent at the head office in Hamilton, Ont. Practically throughout this time he has been connected with the bolt, nut and forgings branch of the firm's business.

Canadian Machinery is informed that no appointment has yet been made of a successor to Mr. Hood at the Swansea office of The Steel Company of Canada.



An automobile without a front axle is the proposed product of the Colonial Motors Limited, recently organized with a capital of one million dollars under a charter from the Province of Ontario. Head offices have been established in the Exchange Building at Windsor and negotiations are under way for the purchase of the war-time plant of the Canadian Detroit Lubricator Co., in Walkerville. The car, which is being demonstrated in and around the Border Cities' is a medium sized six, and is called "The Canadian." It weighs about 3,000 pounds. Earl G. Gunn, formerly with the Packard Motor Car Co., and designer of the engines of the Cole Aero-Eight and of the Oldsmobile Eight, is the designer of "the Canadian" and chief engineer of the new company. Mr. Gunn has recently designed an engine for a new American car which has not yet been announced. The Colonial Motors will have the exclusive Canadian rights to this engine. The one radical feature of the car is the construction of the front end. Instead of the usual 1-beam front axle, the steering knuckles, or spindles, are attached to the ends of two parallel, transverse, five-leaf springs placed one above the other with six inches between them and bolted at their centers to the frame of the car. The object, of course, is the absorption of shocks in travelling on rough roads. The company which is claimed to have no connection with any United States firm is composed of New York and Pennsylvania men. They declare it their intention to make a real Canadian car, using Canadian labor, and as far as possible Canadian materials.—

GEOMETRIC COLLAPSING TAPS

Do 50% More Work Than Solid Taps Can Do on the Same Job

The job shown is the tapping of Malleable Iron Hose Nuts, 4"—8V

In the Railroad Shops where this photograph was taken, there are a great many Geometric Thread-cutting Tools in use. They say their reason for using them is that they find the Tools give **perfect satisfaction.**

With the Geometric Collapsing Tap there is no backing out—thus cutting down the time and cutting out the waste of damaged threads. The Micrometer Adjustment allows for wear of the Chasers and keeps the size exact.

Apply a Geometric Collapsing Tap to Your Screw Machine, Turret Lathe or Live Spindle—and Watch Production Grow

CORROSION OF IRON AND STEEL IMPORTANCE OF SIMILAR MATERIALS

At a recent meeting of the Railway Club at Montreal, Allerton S. Cushman, A.M. Ph. D. director of Institute of Industrial Research Inc., Washington D. C., read a paper on the "Corrosion of Iron and Steel" dealing particularly with the developments of the last ten years.

Speaking on the subject of a book he wrote in co-authorship with H. A. Gardener on the "Corrosion and Reservation of Iron and Steel" during 1910, he said that here was advanced the electrolytic theory of the corrosion, or better expressed, the electrolytic explanation of the corrosion of metals. This statement is briefly as follows:—No metal can corrode or rust unless it first enters into solution in water or some watery solution or liquid medium. Having entered into this solution the atoms of the metal obey the laws of electrolytic dissociation. Put in practical language it may be stated that iron cannot corrode or rust unless water is present to act as a medium and unless also oxygen is present to complete the oxidation. Water causes a small portion of the metal surface to dissolve, as it were, and in dissolving the basic chemical construction of the dissolved metal is unstable and breaks up into small groups of opposite electric polarity. The electric activity increases the chemical activity and the process progresses with familiar results.

The exposure test to the atmosphere is altogether different from immersion tests and the results of one test will not permit any conclusions being drawn in regard to the other state of affairs. The doctor was rather reluctant to admit that copper, varying from a trace up to 3 per cent., introduced into iron was beneficial. In the case of immersion tests he stated it was actually detrimental, as it only tended to increase the trouble. In tests of atmosphere exposure the best he could say was that it did not do any harm. The result of his experiments was that pure iron, that is to say iron with all constituent elements such as sulphur, silicon, manganese, carbon phosphorus, etc. reduced to a total of not more than 0.16 per cent. gave the best results, as regards its ability to resist corrosion, as was particularly shown in the case of sheets and plates, etc., manufactured from this pure iron.

In the cases where metals are immersed, or a state of partial immersion exists, such as in boilers, water pipes, etc., some peculiar phenomena were described. The doctor stated that if the oxygen could be removed from the water, corrosion on the inside at least would cease. Some years ago he advocated the passing of water over iron turnings and filings before entering a system, pipe line, or boiler, and there extract oxygen from the water. Experiments along this line, conducted over a wide range of conditions and over an extended period of time, had shown that corrosion is absolutely stopped by this method, as far as all practical purposes are concerned.

Mr. Job of the firm of Milton Hersey & Co. stated that only a short time ago a boiler tube had come to his attention for analysis. In one place it was in perfect condition, and at a point not 18" away it had been corroded completely through. It was found that this corrosion had taken place in the short period of three weeks. The analysis showed the tube to be of first class metal homogeneous in stricture throughout. The cause of corrosion was that the corroded point was directly in front of the boiler feed water inlet and the oxygen in the feed water stimulated the corrosive action.

Another factor that stimulates corrosion is the riveting up of steel plates with rivets of a different chemical analysis. An instance of the effect of corrosive action due to this cause was the American light ship stationed off Cape Hatteras. This was a steel ship fabricated to the best government specifications and of very heavy construction. Swedish low ore iron rivets were specified and used. Inside of a year the ship was leaking badly and an inspection showed she was in dangerous condition. She was towed to Norfolk, Va. and examined. The rivets had become mere strings, likened to the straws of a whisk broom. An electric couple had been set up and rapid corrosion occurred. To offset such a condition it is necessary to use rivets of precisely the same analysis as the material they are holding together, or at least as near the analysis as practical. If steel rivets had been used in the above mentioned light ship she would undoubtedly be intact to-day.

Railway signal towers built several years ago on the Boston and Maine railway from a more or less mixed stock of material on hand at the time showed rapid corrosion, and it was found that the angles and other shapes entering into the construction were of widely varying analyses resulting in the harmful electric couple being created followed by the inevitable results of corrosion under such conditions. Departing a moment from the consideration of iron and steel, it was shown that a new copper roof which was tinned was corroded into a mass of finally perforated material inside of a year. Had the copper not been tinned the roof should have been good for a century as no electric couple would have been set up.

The corrosion of brass condenser tubes in a non-uniform manner was touched upon. Experiments had shown that if brass was poorly annealed and internal strains were thus present, that corrosion invariably occurs as zinc is lost from the brass under such conditions, and the physical properties of the metal are weakened and it consequently breaks down. In the general discussion that followed the reading of the paper, professors of metallurgy at McGill, Milton Hersey, representatives from the American Rolling Mills, The Pedlar People, Oshawa, and many other men, prominent in the metallurgy field, gave various experiences of corrosion difficulties.

An aged consulting engineer from Russia, Mr. Gordon, expressed his deep appreciation of Dr. Cushman's paper and related an instance of a bridge over a river entering the Sea of Azof where an electrical couple had been set up between the rivets and the bridge members with the resulting rapid corrosion. He stated that in repairing, a special paint was used to insulate the new rivets from the members. The results he was not able to give, as the recent troubles had driven him from that section of the country. It was the opinion of Dr. Cushman and others that the paint was a good insulator and the success of the expedient depended entirely on the life of the paint and its ability to resist deterioration.

PECULIAR REPAIR JOB

A job which has been bothering expert engineers for some weeks past is the repair of the Bascule bridge over the St. Mary's American ship canals, and said to be the largest bridge of its kind in the world. Early in October, gusset plates were found torn in the bridge with the counter weight at the southern end of the jackknife displaced. One support beam was broken and another badly twisted, and C. P. R. connections across the bridge were held up for over a week, while 100 men were rushed from Chicago to effect repairs. Traffic has been resumed, but the southern span has to be kept stationary, and cannot be raised. The cause of the trouble originally is believed to have either been from a flaw in the material in the gusset plates, or from some sudden impact on the bridge. The structure has been in operation since 1914, and by reason of its opening up in the centre, by means of counterweights at either end, with the spans raised perpendicularly, it is known as the "Jackknife bridge." The counterweight at the south end was lowered four inches out of place. It is a cemen block 1400 tons in weight and to get i back in place with a limited amount o room for the workmen proved difficult Over 30 jacks were used, fifteen 100 to compressed air jacks, ten 50 ton jacks and five smaller ones were put in ser vice. Over 50 men were employed o the jacks alone.

ELECTRIC DRILL

The Black and Decker Mfg. Co., Baltimore, Md., have added a new to to their list, in the form of a "Lig Quarter-inch Electric Drill" with pist trip and trigger switch, designed to dr metal or wood. The drill has an alumi um alloy housing, double reduction gea ing, giving a no-load speed of 1,6 r.p.m., and weighs only five poun The construction is such that it c be used to drill a hole right up in close corner. It can drill within inch of an obstruction. The drill is v accessible and the cord is supplied w a clamp which removes all strains t have a tendency to pull the cable t minals loose.

DIRECTORY OF DEALERS

THE Buyers' Directory of CANADIAN MACHINERY was originally intended to contain information regarding lines actually manufactured by our advertisers. We now carry the advertising of leading machinery dealers, some of whom represent scores of manufacturers in addition to being manufacturers themselves in some cases. This necessarily widened the scope of our Directory, but it would be impracticable to list all the lines handled by all the dealers. We recommend, therefore, if our subscribers cannot find what they want in our Directory that they communicate with the dealers whose names appear herewith.

FOUNDRY
GALT, ONT.

Do Your Castings Cost Too Much?

A rearrangement of your patterns might cut their cost 25 per cent.; a different method of molding them might double your production at no increase in molding cost. We can advise you and we have expert metal and wood patternmakers who are able to make any changes that may commend themselves to you.

If you need some new Patterns

send us a sample, blueprint or sketch, and ask for our advice. It won't cost you anything. If our advice is good and commends itself to you, it is only fair to assume that our work will be equally satisfactory, and we need the work as badly as you need the patterns.

We are in a position to do turning, boring, drilling or other semi-finishing operations on castings supplied by us. Ask us.

We have for our and your requirements, a large stock of assorted White Iron Stars, suitable for light agricultural to medium weight machinery castings, while they last, at 8 cents per lb. F. O. B. Galt.

Rounding the Corner

Better business requires co-operation between buyer and seller.

Manufacturers have made heavier price reductions than the present cost of doing business warrants. We hope to justify these lower prices by increasing sales and hammering away at the costs of production and selling. Substantial economies have already been made along these lines.

Johansson offers his customers the benefit of these economies, confidently counting upon the co-operation of intelligent buying.

In putting new gage prices into effect, we have protected all Johansson dealers so they can cheerfully pass these reductions along to the consumer at once. Buyers know the advantage of being served by enthusiastic dealers.

Johansson Gages possess advantages of design, maximum utility, accuracy and permanency which attract the careful buyer. Economy requires no sacrifice in quality.

When you need gages, you need the best.

Consult Johansson.

OPERATED IN CONJUNCTION WITH A CONTINENT WIDE NET-WORK OF DISTRIBUTION STATIONS

"Liquid Air" Oxygen Means a Saving in Transportation

With a network of Factories, not only planned, but in actual operation, and a number of Distribution Stations situated at all large centres all over Canada, Purchasers of Oxygen can obtain their supplies at a point very near to the point of consumption. This completely obviates heavy freight charges on cylinders and assures an immediate supply at any time within a few hours and even minutes after the orders are placed.

All cylinders conform to the specifications of the Canadian Railroad Board and are made to ensure safety without unnecessary weight. When purchasing "Liquid Air" Oxygen you not only save on freight, but in very many cases this expense is almost eliminated.

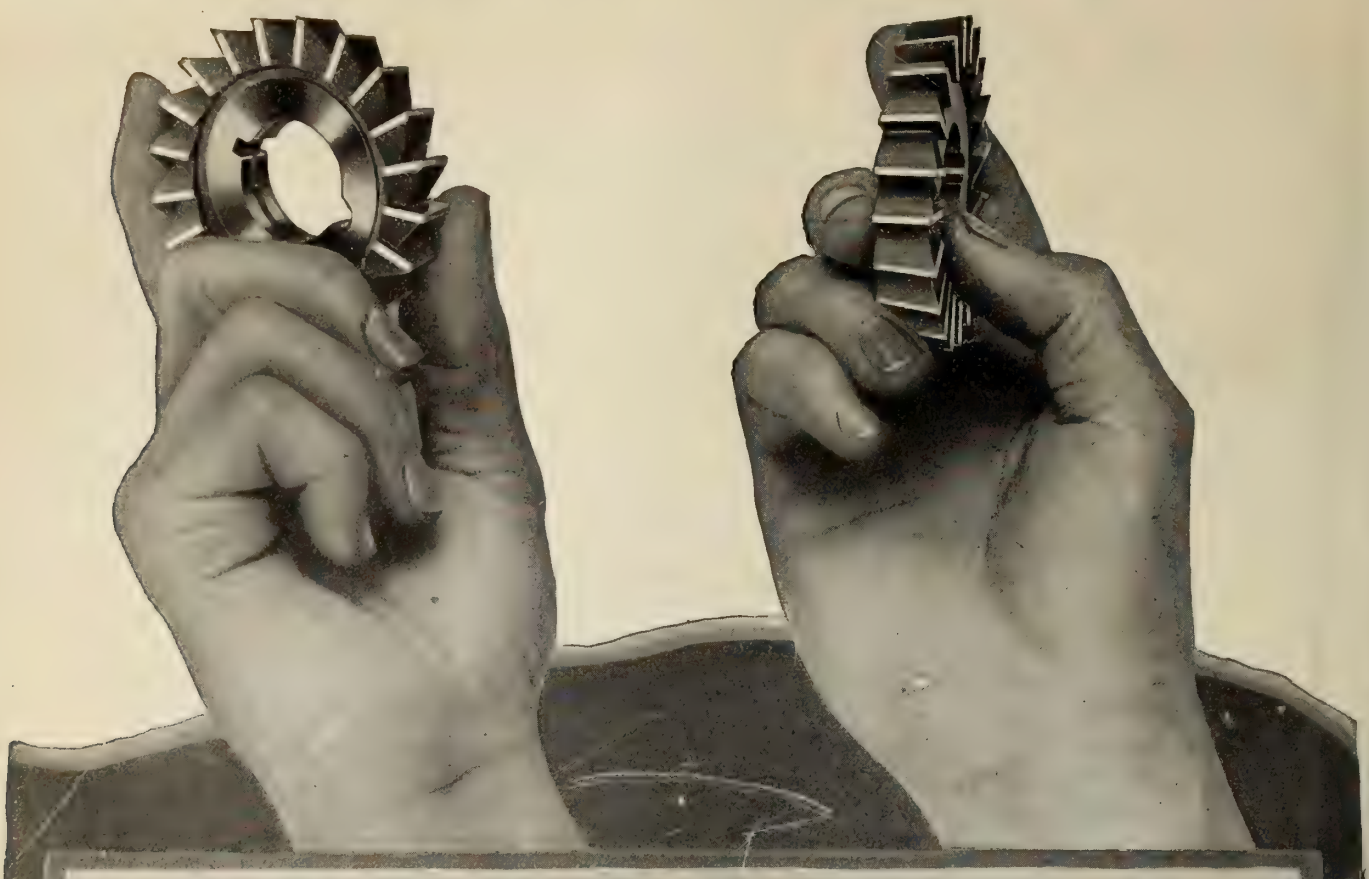
Your Business for 1922

There are indications on every side that business is improving. There is a growing confidence and optimism. There is a realization that the time of waiting is past. There is a noticeable concern on the part of manufacturers and dealers about the coming race for business, and there is already in evidence a keen jockeying for position.

THE YEAR 1921 has been abnormal—an aftermath of the war. The year 1922 will be what you make it. The process of shrinking, deflation and readjusting has been going on with relentless thoroughness. It remains now to take up and carry on from almost the exact point where we left off seven years ago.

The forced apathy and idleness of the past year are giving place to aggressive thought and action, and there is every promise of keen and intelligent sales effort. This is needed if we are to start something. This is a time for aggressive leadership. A forward drive by everybody using constructive sales methods would produce surprising results. There is a responsibility resting with every firm to do whatever can be done to revive business, because whatever is accomplished by one, directly or indirectly affects and benefits the other. All should pull together.

ONE OF THE prime necessities at this time is advertising of a virile, constructive character. It will inspire confidence in the buying public, and it will inspire confidence in the men who are doing the selling. The need of it now is vital if we are to look for a recovery of business. Many firms, through force of circumstances, have been compelled to curtail their advertising, but this policy, if persisted in, would be most disastrous, and its extreme danger would be noticed only after the harm had been done. Many of the largest and most successful firms are big advertisers, and it is a significant fact that their advertising has been kept going to an efficient degree during all the trying period through which the world has just passed. If your advertising has not been kept up to full efficiency during the past year, then your handicap will be all the greater if you postpone a resumption of your publicity.



If you wish to reach the metal-working industry of Canada in a most effective manner, then it will pay you to get full information about CANADIAN MACHINERY without delay. Our "Annual Review Number" will be published Decembr 29, 1921. This will be the biggest buying number of the year, and will be reserved for reference purposes for many months. You should have an effective message in this number and follow it up with regular space.

1922 will be largely what you make it.

If it's speed you need--

One trial will prove the advantage of Pratt & Whitney Milling Cutters. No matter what the nature of the work they will give you the highest production the machine is capable of.

They're designed for free, fast cutting. And tempered and seasoned to last longer.

PRATT & WHITNEY MILLING CUTTERS

Ask us for prices and details on Plain Milling Cutters, Side Milling Cutters, Inserted Blade End and Side Cutters, Screw Slot Cutters, Coarse Tooth Side or Plain Milling Cutters, Involute Gear Cutters, Concave, Convex and Double Angle Cutters, Cutters for Spiral Mills, Roll Thread Die Hobs, Key-Seating and Slotting Cutters, Straight and Spiral Cut End Mills (B. & S. and M. T. Shank), Spiral and Straight Shell End Mills, etc.

And we make formed cutters for special work also. All are backed by the guarantee for goodness that the P. & W. trademark indicates.

It is just as unreasonable to attempt a filing job with a file that has begun to get dull as it would be to run a machine without oil.

Full service from a file is possible only when the teeth cut keenly.

Discard a file as soon as it ceases to do this, and buy a new one.

To get long-lasting efficiency, specify one of these brands:

STRENGTH

Strength is a very essential quality in a wrench, but it does not depend entirely upon bulk or weight of metal. The strength and long-lasting qualities of Armstrong Wrenches are the result of skilled combination of the Best Steel, Expert Design, Accurate Machining, and Heat Treatment. All kinds and sizes.

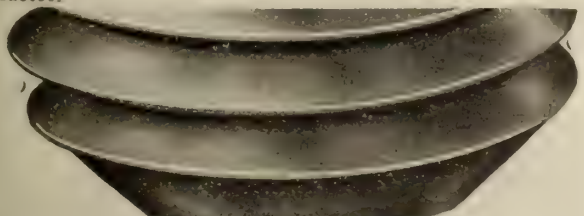
TRADE MARK

BRISTO



REG. U. S. PAT. OFFICE

PATENTED SAFETY SET SCREWS

SET A NEW STANDARD

The distinctive dove-tail slots or flutes of the "Bristo" safety set screw are one of the features which put "Bristo" in a class by itself. "Mushrooming," for instance, is impossible, and splitting or cracking have been removed from the list of your manufacturing worries. As the wrench turns, the unique "Bristo" design contracts the screw; on releasing the pressure the screw tends to expand—a tremendous gripping factor.

STEEL TANKS

LIGHT and HEAVY

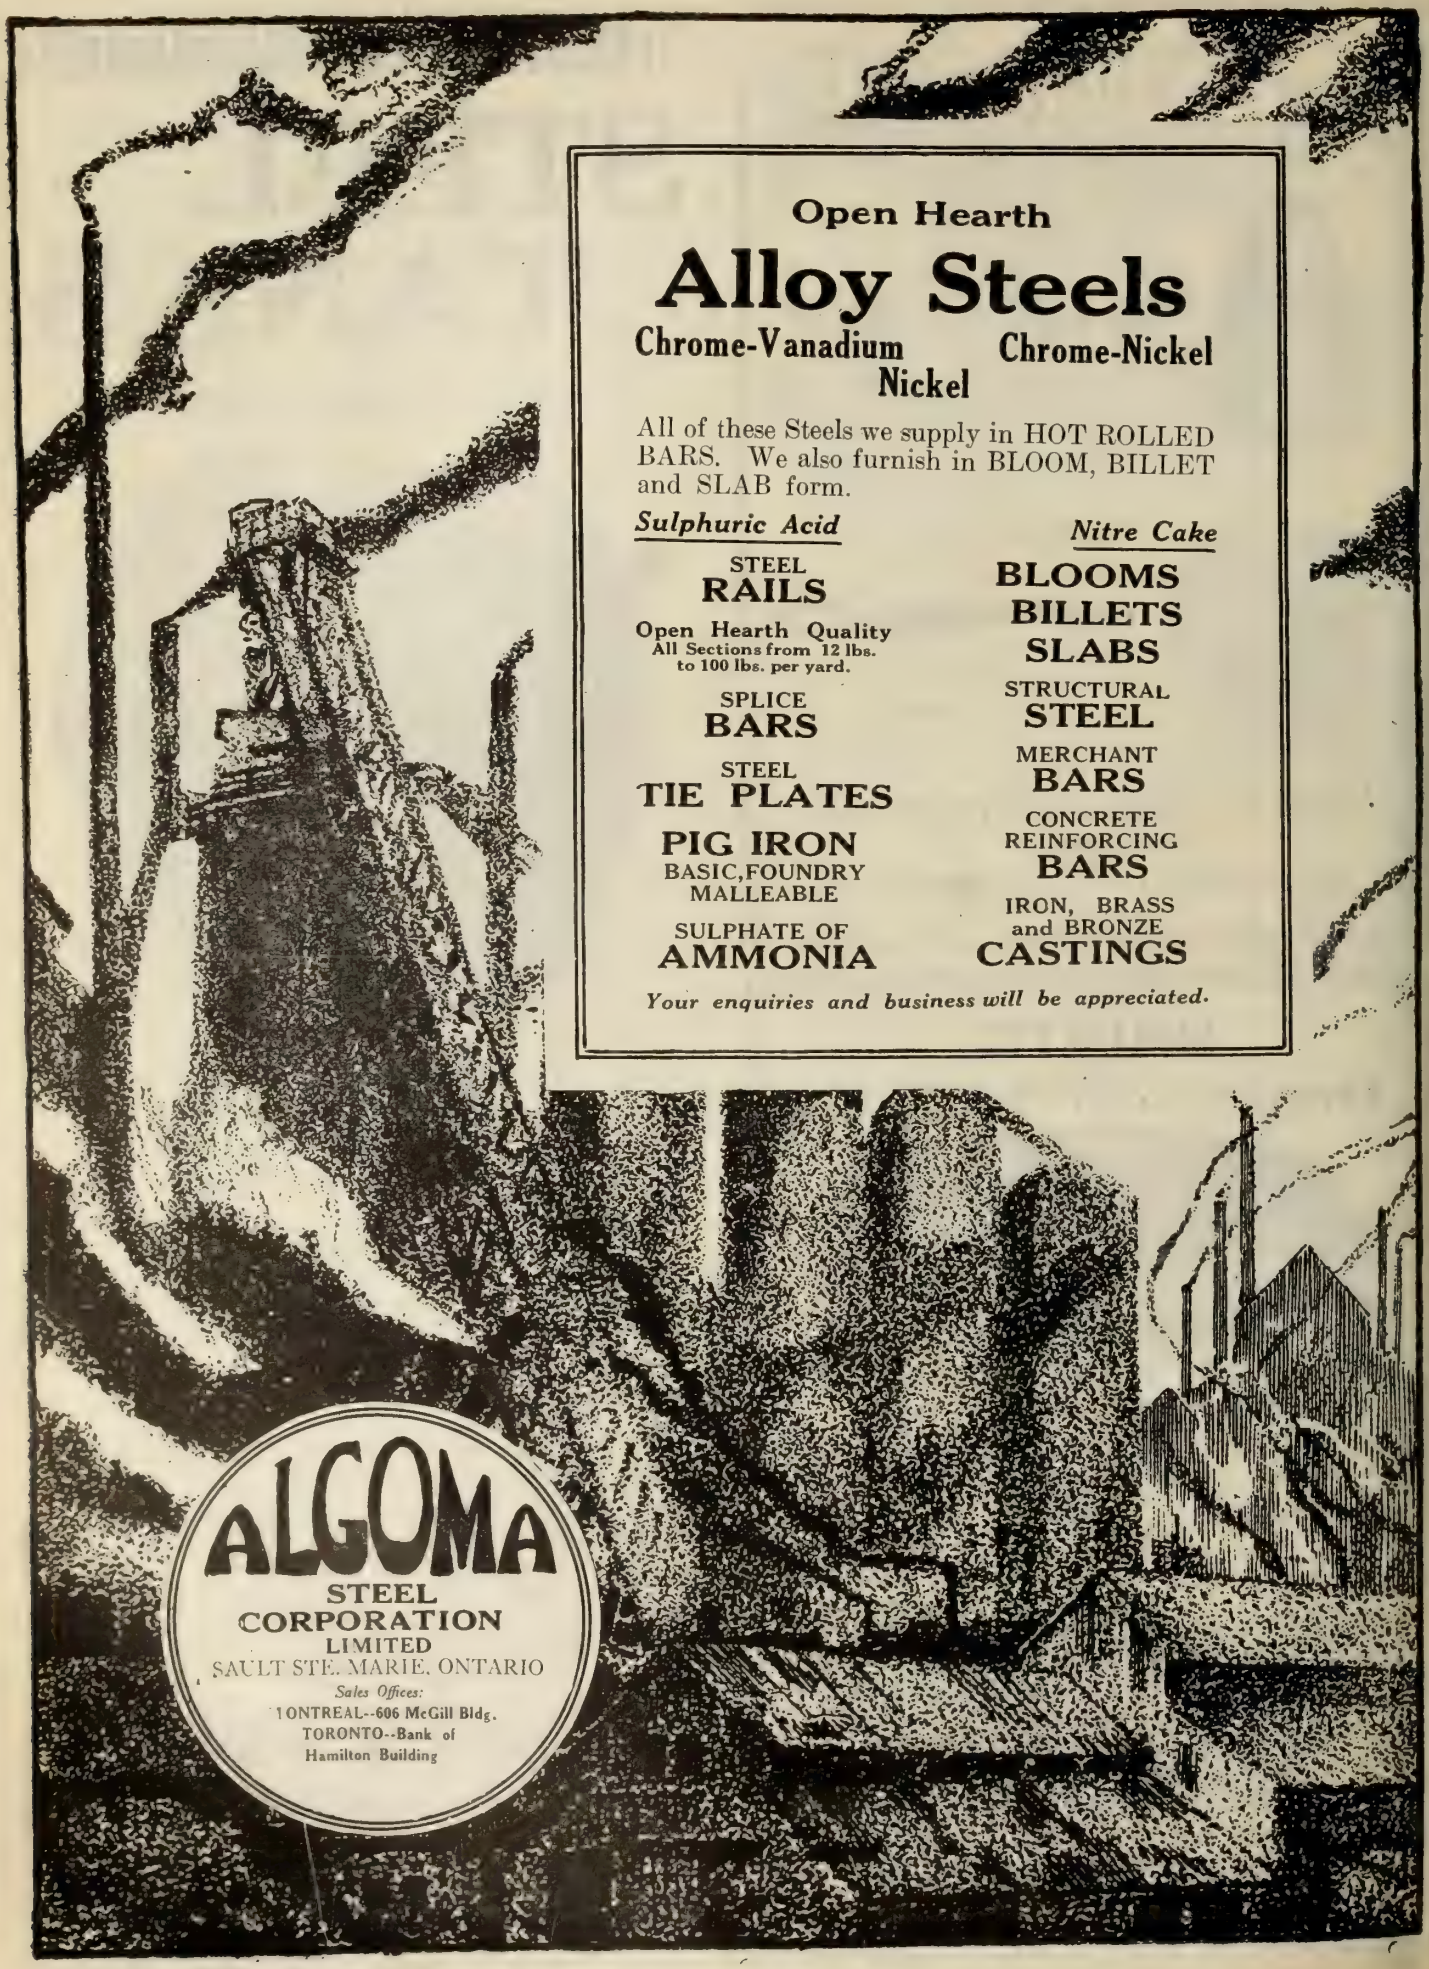
T.I.W. STEEL PLATE CONSTRUCTION

If it's a tank or any piece of steel plate construction we can make it.

Here are a few of our lines:

STORAGE TANKS
for—
Oil Refineries
Oil Distributing Stations
Sugar Refineries
Distilleries
Packing Houses
Soap Works
Chemical Works
Asphalt Plants
Cyanide Installations
Varnish Works

PRESSURE TANKS
Filter Tanks
Air Receivers
Hydro-Pneumatic Tanks
Hot Water Tanks
Blow-off Tanks
Steam Jacketed Tanks



BINS and HOPPERS
for—
Coal and Ash Handling Systems
Grain Elevators
Mines and Quarries.

SMOKE STACKS
BOILER BREECHINGS
RIVETED STEEL PIPE
PENSTOCKS
CAISSONS
TANK WAGONS

Consult us about your requirements or for Acetylene or Electric Welding.

WRIGHT HOIST

Speedy — Powerful

A hoist that is built to stand the hardest service. Easy to handle—a lift that is absolute at any height. Will outlast any hoist on the market.

Start with a **Wright** and you finish right.

Let us send you a catalogue.

WRIGHT MANUFACTURING COMPANY
LISBON, OHIO, U.S.A.

Do You Read These Advertisements?

Every advertisement in this magazine is worth reading. It is the product of some concern that is using a modern method of making sales, viz., technical paper advertising, in order to present most effectively to you the leading features of its line.

These advertisers are making it easier for you to buy intelligently with the least waste of your time and theirs. They realize that a sales force cannot replace this service at equal cost. They know that advertising is good business, for the manufacturer who does not advertise cannot save the cost of advertising. Consistent advertisers are progressive merchandisers. They are saving your money and their own; and it pays to do business with them.

Don't miss your opportunities. These advertisements are interesting. Many are distinctly instructive, and a glance through them every month will keep you posted on the latest developments for machinery equipment.

THE JOHNSON FRICTION CLUTCH

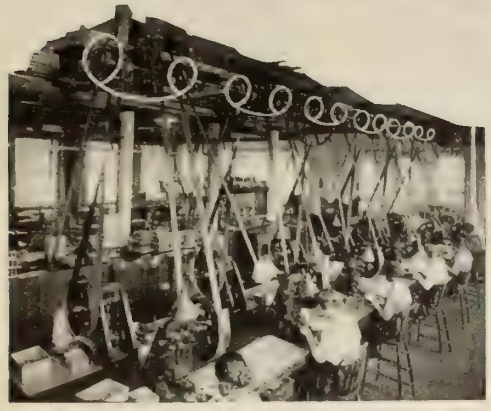

Illustration by courtesy of The New Departure Manufacturing Co., showing bench presses in operation at their Elmwood Plant.

It's a Johnson Lineshaft Drive

A battery of twelve light presses, all on a bench about 30 x 5, driven from one lineshaft with Johnson Clutches controlling the machines.

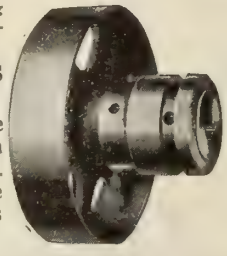
COMPARE IT FOR FIRST COST

Twelve Clutches against twelve complete counter shafts, or twelve individual motors.

COMPARE IT FOR EFFICIENCY.

Quick, smooth control against the sluggish tight and loose pulley. Or one motor consuming current instead of twelve.

COMPARE IT FOR SERVICE.



You know the failing of belts—the continual attention they require, especially when they are shifted. If you don't know Johnson Clutch Service, just give it a trial.

Write for our booklet

"Clutches As Applied to Machine Building" and our Yellow Catalog.

FRICTION CONTROL MEANS BETTER MACHINERY

We specialize in applying the proper type of friction clutch on any sort of an installation. Standard clutches available from stock, and special models developed to suit conditions.

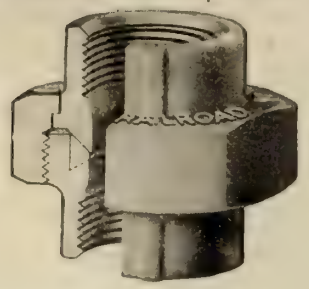
CUTLER - HAMMER

Magnet and Control Devices



¶ Cutler-Hammer Lifting Magnets and Magnetic Separators have proved of exceptional value in the mining field, in steel mills and in many other industries for lifting and separating metals. The Magnetic Clutch and electrically operated Brake, used primarily in steel and rubber mills and for crane control repectively, are widely applicable to many industries where the gradual engagement or adequate braking of a load is desirable.

¶ In electric controlling devices of all kinds Cutler-Hammer is the recognized standard of dependability, whether for fine speed adjustment of a machine, extremely close voltage regulation, the wonderful light dimming and colour effects in a modern theatre, or the automatic control of heavy loads or other special operations.

¶ Details and recommendations of suitable Cutler-Hammer apparatus for your control problems are available at our branches.

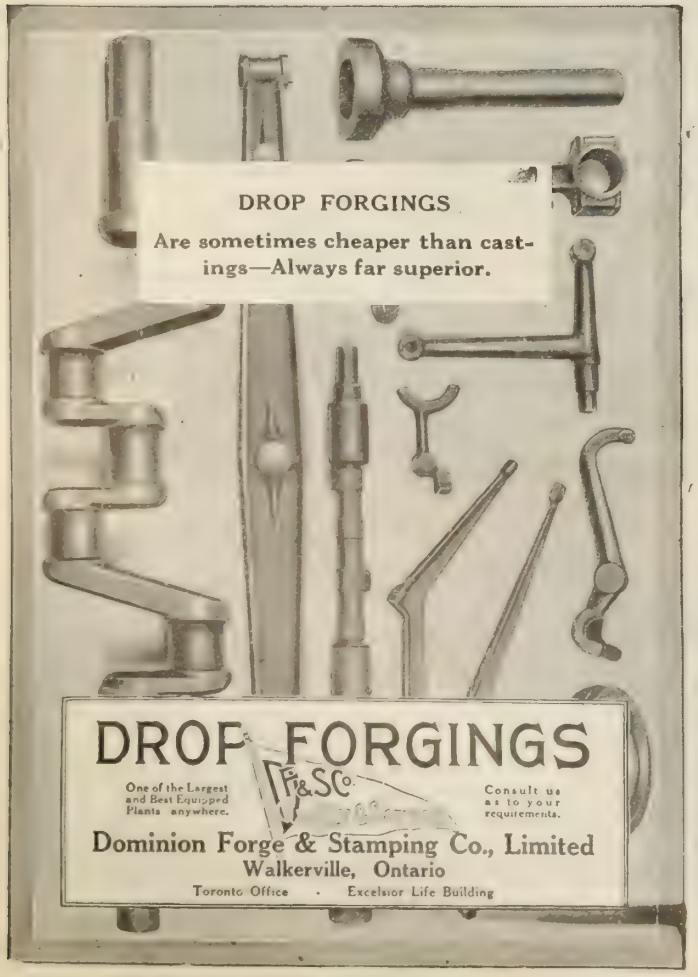
Increase Production— Reduce Expense

Operators of Power Plants and Engine Rooms and other machinery for which Lubrication Systems are required report savings in lubrications costs of as high as 60% when they filter their oil. Filtration makes it possible for them to use the same oil over and over again.

Many have found the solution of these filtration problems in Bowser Filtration Equipment, because Bowser not only greatly reduces the necessary amount of oil used, but keeps it *pure and clean.*



Thus the Bowser System reduces operating expenses and increases production.

That's why Bowser Equipment will be a profitable investment for you.

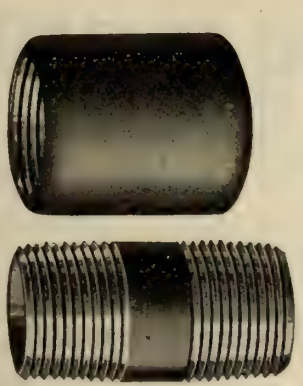
Save Your Steam!
Get Care-free Service!

HEPBURN
Steam Pumps



Combine two advantages so much sought after in an up-to-date pump. *They economize in steam*—on account of the long regular strokes and the absence of water in the steam cylinder. *They give care-free service*—because there are no levers or tappets to get out of order. Working parts are few, and the valves are accessible. A glance at the illustration will show this.

Whether you want Pumps or Vertical Engines, Compressors, Winches, Cranes, Power Presses, or just Castings, we can give you satisfaction. Our representative will be pleased to call and talk over your problems with you.

Precision tools are more than just "tools"

They are the standards by which the accuracy or quality of the work done by other tools is gaged. A precision tool must, therefore, be a tool of the most extreme and dependable accuracy.

For more than forty years the highest standards of accuracy have been maintained in the production of Starrett Tools. By their dependable service they have earned the preference of two generations of machinists.

Accurate Weights Instantaneously

IN machine shops and industrial plants throughout the world, Fairbanks-Morse Dial Scales are giving assured protection in eliminating beam readings. The correct weight shows instantly, in plain figures on a big dial, as soon as the load is moved on to the platform. These Scales are self-contained, all metal, strong and durable for constant service. They save money because they save time.

You can secure a Fairbanks-Morse Scale to suit your particular requirements in the weighing of all incoming or outgoing material, while being loaded, unloaded, or otherwise moved by cranes, hoists, etc.

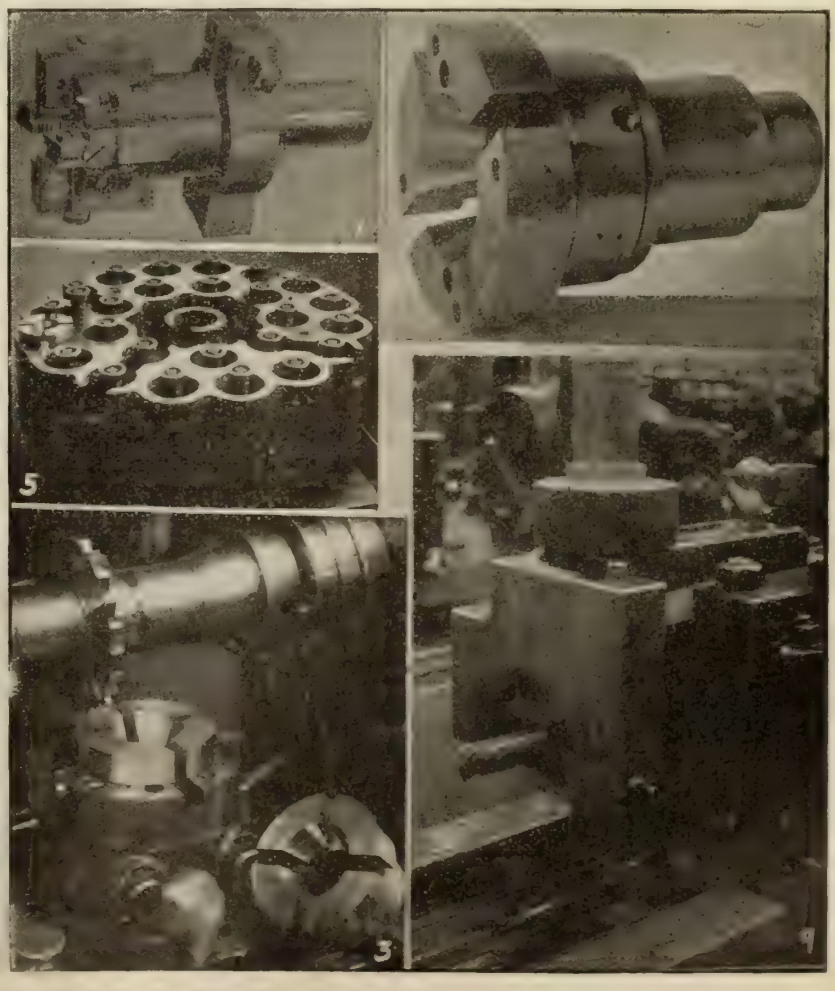
CANADIAN MACHINERY
AND
MANUFACTURING NEWS

VOL. XXVI. No. 21 NOVEMBER 24, 1921

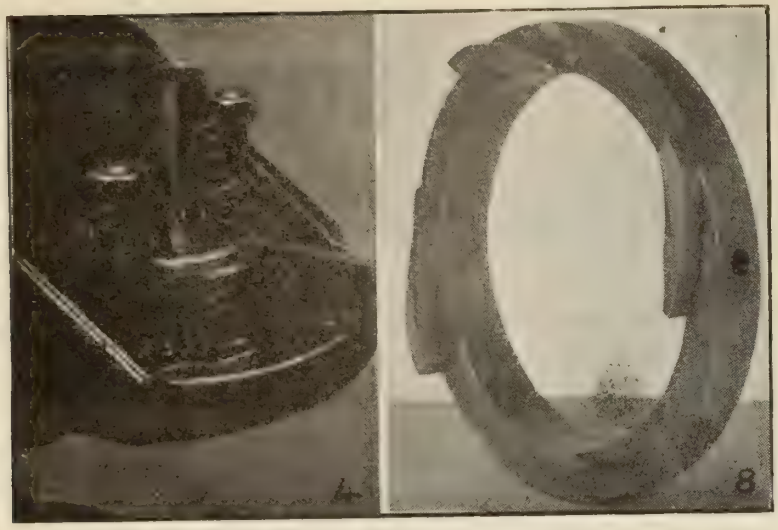
Accuracy is First Essential in a Die Head



Manufacturing a Die Head Calls For Careful Workmanship—Operations Are Varied — Tooling of Work Receives Careful Thought—Improvement in Design Has Come Gradually.

THE manufacture of screws and screwed parts obtains today on a scale which is prodigious when compared with that of a score of years ago. Not only is the quantity produced larger than formerly, but more stringent limits of accuracy are demanded. The diehead whose manufacture we will touch upon, is not a recent innovation, although its full possibilities have only in comparatively recent years begun to be appreciated. The early dieheads were used on bolt and pipe screwing machines and at first were opened and closed by hand, the automatic opening feature being a later development necessitated by the use of dieheads on rotating spindles.

Fig. 1. illustrates a die designed for use in a turret screw machine, and is taken from the "American Machinist," June 7, 1894. This was known as the Tucker opening die, and was so made that when a thread had been cut the die opened and could be run back without reversing the machine. These early dieheads effected great reductions in the time required to thread bolts as compared with cutting in a lathe or by solid dies. These early devices, however, were incapable of producing an accurate and well-formed thread, the reasons being that the dies were produced by a tap, and also were made either so as to get the clearance—but with no guiding or pitch-preserving feature—or to hug the thread and so to some extent guide themselves along it, but without cutting clearance, the result in either cases being more or less rough threads. The practical result was that dieheads were never used for high-class work, but only for rough bolt and pipe work.



For a long period the screws turned out by automatic screw machines and turret lathes were threaded by dies which had to be reversed and screwed off the work after threading, these dies being of many varieties—some solid, and some split. All these dies labored under the disability that they had to be unscrewed from the work, taking up time and often damaging the threads. Other difficulties were absence of adjustment to obtain exactly the fit required, the practical impossibility of sharpening them and the fact that they were seldom accurate in pitch owing to distortion in hardening and original error in the master tap from which they were made. It will be readily understood that the advent of the self-opening diehead in a form suitable for use on automatics and turret lathes was eagerly welcomed. The stages of improvement in design covered quite a period of time, but now the mechanical world has dies that are marvels of accuracy, but let us get on to some of the actual operations on one particular type of die head.

Fig. 2 shows the body which carries the dies. The dies fit directly in it without the intervention of carriers or shoes, and the guide for dies is long in proportion to its width.

Figs. 1-2-3-5 and 9.—See text for description

Data and illustrations through the courtesy of Alfred Herbert Ltd., Coventry, England.

Figs. 4 and 8 — See text for description.

The body comes to the machine shop in the form of a forging of high quality carbon steel. The first operation is on a combination turret lathe, where it is rough turned, finish turned for grinding, drilled and chamfered. It is next supported on an arbor between centres on a universal grinding machine. The keyseating operation follows, which is performed on a horizontal duplex keyseater; keys are next fitted into the shank, and all subsequent operations are located in relation to these keys. The body is then taken to a horizontal miller for the milling of the slots for the dies. Fig. 3 depicts this operation. There are two milling operations at this stage, roughing and finishing. The fixture is designed for accurate indexing in four positions. The very finest limits of accuracy are called for both for width of slots and centralization; to ensure this the slots are finally finished on a broaching machine, the body being held in a special fixture, as shown in Fig. 4. The drilling of the four holes for the front plate screws is the next operation.

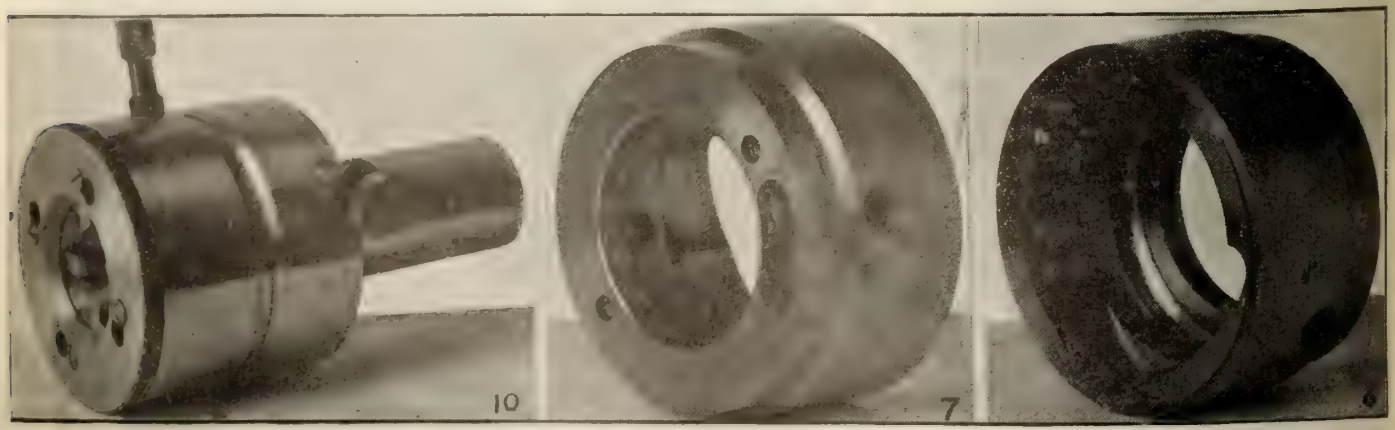
We now come to the surface grinding of the front face of the body, which brings to our notice a very interesting grinding fixture. This is shown in Fig. 5. This fixture will hold 25 bodies at a time, these being accurately located on the studs. The top surface of the fixture is frequently skimmed up in position on the rotary grinder on which it is used to ensure accurate location. The fixture is placed on the magnetic chuck of the grinder, and it will be noted that it is of ample dimensions to preclude any possibility of distortion. One diehead body is shown in position. After every operation a rigid inspection takes place.

The External Scroll

Fig. 6 shows the external scroll which fits over the body. Its function is to close the dies and to take their end pressure when working. The scroll surfaces extend to the ends of the dies, so that the pressure when cutting, beds the dies against the scroll and removes all tendency to tilt or to become bell-mouthed. Screwed into this external scroll is handle for closing the head by hand, and a trip peg for closing it automatically when used on automatic screw machines.

The external scroll is machined from a steel blank cut from the bar. The first machining operation takes place on the automatic lathe. The first operation is the roughing out of the shoulder to provide a true grip for the subsequent machining operations, also the rear face is turned, rough drilled and chamfered. The next machining operation is the reversing of the piece and holding by soft jaws. Here the finish turning of the scroll takes place.

The next is a milling operation. The scrolls which locate the end of the dies are milled on a vertical milling machine in a special 4-position indexing fixture which is of large size to ensure the necessary accuracy The fixture is accurately offset from the centre of the circular table to give the correct curve. Fig. 7 shows a rear view of the scroll. The annular recess will be noted for the reception of a hardened abutment or tooth; this annular slot is machined on a vertical mill. A subsequent operation is the surface grinding of the back face with the hardened tooth in position in the annular slot.



Internal Scroll

Fig. 8 shows the internal scroll which is attached within the external scroll. It is furnished with four cam-shaped projections which engage the notches in the back of the dies for positively withdrawing the dies from the work when the diehead opens. The internal scroll is made from steel bar. A bar blank long enough for a dozen rings is chucked in a capstan lathe, turned, bored (an allowance being left for grinding) and cut off. The scrolls are now placed on a mandril and ground externally on a universal grinder.

The next operation is a milling one, the "landing" slots being milled out to afford clearance for the subsequent milling of the scrolls. A special fixure is used on the vertical miller and the same fixture is also used for milling the curves on the outer scrolls, the necessary special adaptor being fitted.

The Front Plate.

The front plate is of steel, hardened and ground. It is attached to the body by four screws and the plate is furnished with elongated or bayonet holes which permit of the rapid withdrawal of the plate without completely withdrawing the four holding screws. This plate is lipped over the external scroll so as to exclude dirt, and these plates

Figs. 6-7 and 10 — The latter view shows completed die head.

are ground on the surface grinder. They are machined from pieces from the bar, one blank long enough for a dozen plates being bored and turned before cutting up into individual plates. The outside is knurled, the rear face is formed and the external diameter chamfered.

The Shank

The shank, which we will next consider, supports the whole of the die-head and also carries the tripping and size-adjusting mechanism. It comes to the lathe in the form of a good quality high carbon steel forging. The forging is chucked by the big end, and is rough turned and drilled with a special box tool shown in Fig. 9. Another box tool is swung into position and finished turning rough reaming takes place.

At the end of this sequence of capstan machining operations the job is in the condition shown at the top of the box tool in Fig. 9. It is rechucked in soft jaws on a capstan lathe, and finish machined for external grinding. A subsequent operation is grinding.

The next operation is on a thread miller, where the boss for the adjusting ring is externally threaded. Subsequent operations include drilling on sensitive drilling machines, the shanks being held in special jigs. This is followed by a slotting operation on the body for the keyways. A vertical mill with circular table is employed for milling the elongated slot through which the bush carrying the detent pin works; clearance must be provided in this slot to accommodate the full travel required for adjustment.

(To be continued).

Operations in the Manufacture of a Die Head

HAVING presented in the previous article, the making of a certain class of die head, let us touch briefly upon the operations performed on another make of self-opening and adjustable screw cutting die head. A few of the operations only are illustrated, the rest being word pictures as it were. The head described is built particularly for B. & S. automatics, but is also well adapted to other makes.

Fig. 1 illustrates the various parts in detail.

These parts, named in the order in which they are illustrated, are: skeleton, cam, cam spring plate, back part, trip lever, and various small parts. The first operation in the making of the head is the turning of the body from bar stock. This is accomplished in the turret lathe. The preliminary to the making of the head is scheduling the operations for the various parts. The schedule and order of operations are as follows:

Skeleton—turning in turret machine; milling chaser slots; truing face of skeleton; inspection; stamping size etc.; broaching chaser slots to gauge; drilling in jig; drilling and counterboring for anvil; tapping for back part screws; milling stop plunger slot; truing back face; inspection; milling keyways of chaser slots; inspection of keyways; assembling chaser keys, drilling, disassembling, hardening, and reassembling chaser keys; inspection of key alignment.

Cam—turning; drilling in jig; profiling the lugs; milling recess for segment pin; drilling for push buttons; tapping and burring; inspection; hardening; polishing of spring chamber to remove scale; assembling spring stop pins; grinding bore to gauge; grinding lugs to gauge; assembling push buttons; inspection.

Cam Spring Plate—Turning; drilling outline in jig; breaking to the outline; milling slot for trip screw; drilling in jig; finishing the milling of the outline; hardening; grinding shank; polishing.

Trip Lever—Milling to thickness, also inside and outside form; drilling in jig; form-milling ends; burring; case hardening.

Assembling skeleton, cam, and cam plate for outside grinding. Grinding outside diameter; polishing; assembling die head complete for final inspection; inspection; cutting test; testing of sample screw for lead. The rough turning of the skeleton is taken in one cut. In this particular instance about two inches of stock is removed, although on larger and special heads over three inches of stock is removed in one cut. Milling the chaser slots in the skeleton is one of the most important operations, as they must be milled to very close limits, allowing only from .001 to .0015 for the finished broaching.

A special measuring fixture is used for inspection of keyways, for the keys must be absolutely true and all must be without the slightest variation. The dif-

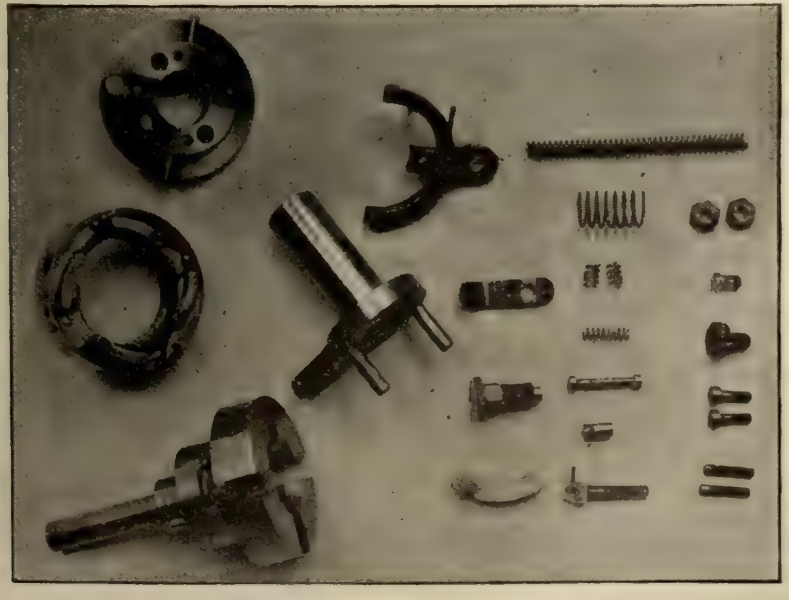

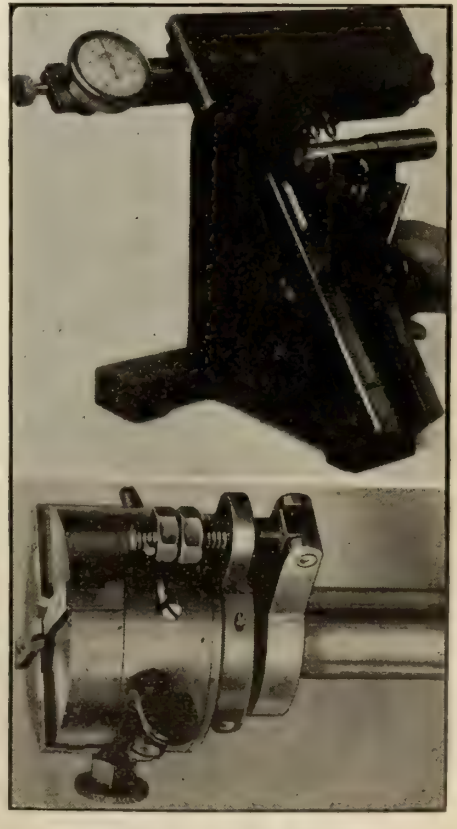

Fig. 1—Showing a die head in detail.

Testing of sample screw for lead.
Completed die head.

ficulties of hardening so exact a piece as the skeleton will be apparent to a mechanic or hardener. The method used, that of special furnaces and special hardening salts, results most successfully. By means of the Bellis Lava heat treatment a uniform heating of the piece is maintained and at the same time scaling and oxidation is eliminated. For profiling the lugs a standard profiling machine is used. Upon the accuracy of these lugs depends the entire accuracy of the operating features of the die head.

Push buttons are used to hold the chasers in place while they are being assembled in the head. Without these push buttons it would be difficult to hold the four or more chasers in position while inserting them. The trip lever as constructed and operated forms a most sensitive trip. It determines the length of screw thread so exactly as to stop the cutting of the screw at any desired point within a few thousandths of an inch. The frequency of inspection will be noted, but this is necessary in maintaining absolute accuracy, and the slightest defect in any operation means rejection. About the best way to get the most benefit of the other photographs shown would be to read the underline, then study the fixtures used, for each one is self-explanatory.

Sixty Ton Hopper Bottom Box Cars

THE Canadian Pacific carries a huge amount of grain from the Western Provinces to the head of the lakes and the Atlantic seaboard. This grain has usually been transported in box cars of design not far removed from the ordinary type. These cars when carrying grain were always fitted with temporary grain doors made from rough lumber. In addition, unloading operations were attended with more or less difficulty and apparent waste of time. To overcome these conditions they have developed and built in the Angus Shops a hopper bottomed type of car, which has recently been placed in service on the western lines hauling grain.

Railroads carrying a heavy merchandise traffic usually consider the cubical capacity limits the load in a box car and therefore a 40 ft. car with a limit load of 45 tons is most economical. The new car is 40 ft., 6 in. long, 8 ft. 6 in. wide and 9 ft. high, inside dimensions, and the limit load is 60½ tons. The ratio of the load to the gross weight is 71.4 per cent. Now as a great deal of grain and coal is carried in box cars on the C.P.R. the extra cost of the heavier car is, no doubt, more than offset by the higher ratio of load to total weight in a fully loaded 60 ton car.

Construction

The cars are provided with steel under frames, steel side frames, corrugated steel ends and outside metal roofs. The centre sills are made up of two 12" channels continuous from end to end of car. The bolsters and cross bars are pressed steel diaphragms with top and bottom cover plates. The floor frames are also pressed steel diaphragms. The wood decking is 2¼ in. thick. It is secured by bolts to the centre and side sill flanges. The side frames consist of 9 in. channel sills 6 in. by 3½ in. by 3-8 in. angle plates, 4 in. Z-bar door posts and U shaped pressed steel posts and braces. The side sheathing is of wood 1½ in. thick. It is bolted to the flanges of the door posts, pressed steel intermediate posts and braces, and to the flanges of the corrugated steel ends.

The pressed steel posts and braces were chosen in preference to the rolled sections, because the ends have area for rivetting, without the use of gusset plates, and the ends of the braces can be brought much closer to the ends of the posts. In addition the pressed shapes provide superior supports for the sheathing boards. The ends of the cars of pressed steel, each end being in two sections. The roof is of the flexible outside metal type supported on steel carlines. All car-line flanges are covered with strips of wood, arranged to prevent the accumulation of dust that might be shaken down from time to time and possibly damage the loading.

Hoppers of the Burnett type are located at the side door opening on each side of the car floor. When used for freight that cannot be dumped through the hopper, the car has a solid level floor, the same as an ordinary box car. When grain, coal or similar commodities are carried, the specially constructed sections of the floor over the hoppers are swung up against the side door posts. This arrangement permits the load to go directly into the hoppers, thus increasing slightly the cubic feet of available space, and at the same time saving considerable temporary door lumber. When it is desired to unload the car, it is only necessary to remove the pin that locks the hopper doors. The doors then open quickly by gravity and a large percentage of the contents of the car discharges automatically through the hoppers. The balance of the load may be shovelled to the middle of the car by hand. However, if an unloading plant is near which is equipped with power shovels, as is the case in most elevators today, the floor door on one side of the car may be swung down and the cables can be taken through the door as usual. The hopper doors have no operating mechanism, the closing being done by hand and secured by a simple locking bar arrangement.

Special care has been taken to obtain a side door of satisfactory design. The interlocking front and back edges afford exceptional protection against both weather and pilfering. The top edge is thoroughly waterproof, yet so designed that it cannot become blocked with ice. The bottom of the doors are fitted with turned rollers that fit on a substantial and rigidly supported track. This latter track is not likely to get blocked with ice but in case it should be, the interference is plainly visible and easily removed. The location of rollers at the bottom of door does away with the binding of cramping so common in cases of doors hung from the top.

The brake arrangement includes a manually operated slack adjuster, which is a double safety device, as it enables inspectors to adjust the brakes to compensate for wear on brake shoes without going under the trucks, and as no truck parts are disconnected, the possibility of trouble due to oversight in replacing connection pins is eliminated. As the time required to adjust the brakes by this device is much less than with the old arrangement it enables inspectors to go over a largely increased number of cars in a given time, a result which tends to better maintenance and less detention. The hand brake arrangements are especially designed to be free of climatic conditions. Snow and ice on top of the pawl, ratchet, etc., will not interfere with their operation. The

Use and Abuse of Wedges in Fixture Design

Slow, Unhandy and Laborious Tasks Can be Made Easy Through the Proper Use of Wedges—Production Can be Increased and Better Work Turned Out

By WALTER ROWLANDS

IN CONNECTION with the use and abuse of wedges we will first consider the illustration at Fig. 1 which shows a method of overcoming the slow unhandy, and laborious task of driving and removing wedges. I say laborious not so much because of the work of putting them in place, as the hard job of removing them afterwards.

The fixture shown was designed to hold the frame at Fig. 2 while being riveted. The previous method was to drive 8 or more tapered wedges, these ranging from ¾ to ⅞ in. and 3 in. wide. Each wedge had a gib, this being to help pry them out after the frame was completed. To say the least, the method was a slow one and required the services of a sledge hammer and pinch bar.

The writer had the fixture, or buck made as shown, and as will readily be seen the wedges are always in position never requiring any attention or handling. The two pins depicted are required to locate and hold the holes in the frame members in perfect position. These pins are never required to be taken out of the hole in the lug on buck which is about 2¾ in. thick for two reasons:—1st the hole being a neat fit for pin always keeps it in perfect alignment; 2nd it avoids the necessity of taking the pin entirely out of the lug, and often saves considerable time from the pin rolling off the block and becoming hidden under the buck or otherwise causing a delay to operators. The two handles marked A A are equipped with loose toggles pivoted on the top of lug and only requires a slight movement to hold the ends of the frame in position. The rivets are ½ in. dia. with oval heads, excepting one which is a flush countersunk rivet. This is handled by taking out one snap with a very small pair of tongs, and substituting a flat faced snap. This is done in a jiffy as the last operation on the buck.

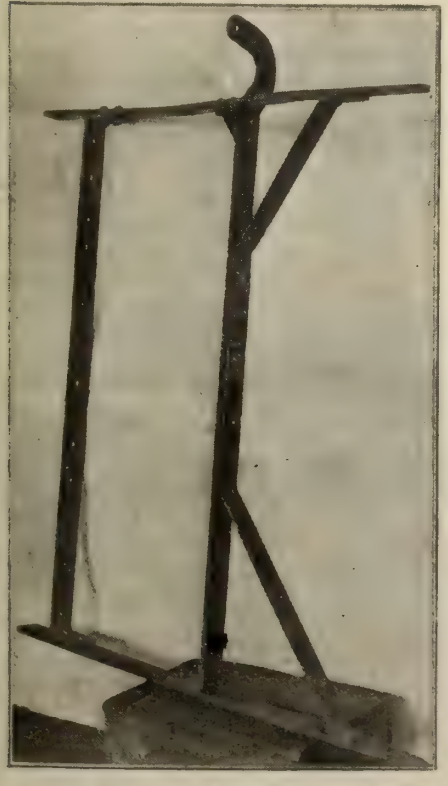

Fig. 2—Showing the frame which had to be riveted.

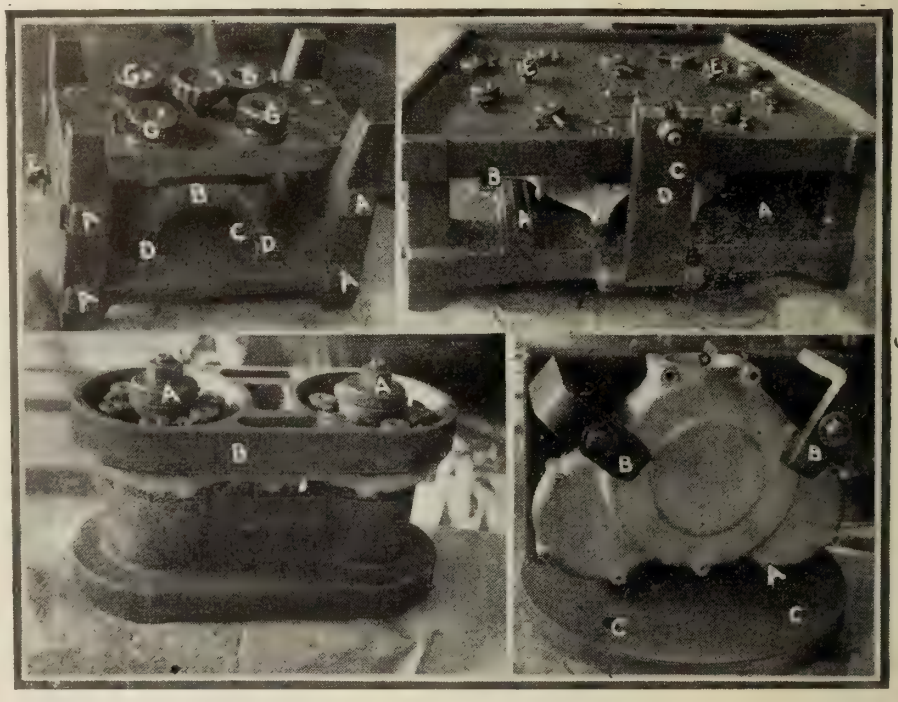
The fixture which was adopted with great success.

The photo shows clearly how the wedges are manipulated. An air cylinder moves the carriage on which are fastened the incline planes, over which and between two links, are the rollers. The movement of the carriage pushes up the wedges fastened between the two links into position. By moving the small lever over in the opposite direction it fastens all members to the buck and accomplishes the work in quicker time than it takes to describe. It is also positive, and admits of a clear buck on top, not littered up with wedges, pins, loose parts, etc.

The air riveter, as will be seen in the illustration is equipped with a device which enables the operator to obtain the proper adjustment to suit the various heights of the rivet centres. Considerable time was saved by designing the riveter to suit the job of frame riveting, as it enabled us to rivet the two gusset angles on the goose neck member (before being riveted to the other portions of the frame) on a power riveter. With a suitable jig to hold the gusset angles in proper position this riveting was formerly done after the members of the frame were riveted together and required to be turned over in order to head up the last 2 rivets in the angles. Anyone conversant with this kind of work will readily understand how slow and uncertain the job was; having to locate and hold the frame and riveter to put in 2 rivets in such awkward and close quarters. The writer was informed that a satisfactory job could not be done by riveting these angles on the goose neck

(Continued on page 32)



Machining Elements on Marine Engines

Drilling and Reaming Main Bearing Cap—Drilling Cam Shaft Driving Gear Housing—Facing Off End of Same Part—Machining and Grinding Camshafts.

By ROBERT MAWSON

IN MACHINING the various elements on marine engines it is often advisable to use special tools, fixtures, etc., for such procedure lowers the cost of manufacture. Murray & Tregurtha Corporation, Alantic, Mass., who manufacture such engines have found it wise to spend considerable money on special tools, and some of the interesting fixtures used will be described in the next portion of the present article.

At Fig. 1 is shown the jig used when drilling and reaming the main bearing cap for the crank case. This casting has been previously machined on the parting in a milling machine. The jig is first placed with the surface A resting on the drill table, and the cap B is placed on the steel pads C, the tool being provided with four, two on each side. The cap is pushed back against the two steel stop pins D, and a knob screw is tightened which forces the element back to the adjustable stop E. The knob screw F, is then tightened the action of this medium being to hold the cap casting down in the jig. The tool is then placed on the drilling table in the position shown, and four 43/64 inch holes are drilled, these afterwards being reamed to 11/16 inch; slip bushings G, being provided to suit both sizes of caps.

Figs. 1 to 4—See text for details.

Machining Gear Housing and Cover

Fig. 2 shows the jig employed when drilling one of the sections of the camshaft driving gear housing. This casting has been previously machined on the parting surface in a milling machine in order to obtain a smooth and accurate join. The casting is then placed in the jig, being slid along the steel ways A, against stop pins at the rear of the tools. Steel pins B, are also provided to insure the correct alignment or position in the tool. The swinging strap C, is next placed as shown, and as this is fastened against the housing, a fixed pin D, coming in contact with the element forces it back to the stop pins used when drilling the mating section of the camshaft driving gear housing. Twelve 17-64 inch holes are next drilled, also the holes in the upper part, the drill being guided through the bushings. shown in the upper cover of jig.

This casting has also been machined at the parting or joint surface in a previous operation, and two large holes have also been bored. These holes mentioned are employed as the locating medium for the casting in the jig, two turned plugs A being provided that fit into the holes thus bringing the piece into the correct position for the drilling operation. The cover B is dropped down over the casting and held by means of two nuts and washers, which can be seen in the illustration. The following holes are then drilled, eight 17-64; two 5-16; and four 13-64 inch, these being guided through bushings in the jig cover in order that the correct position may be obtained and maintained.

The fixture shown in Fig. 4 is used when facing off the end and boring the large hole in the camshaft driving gear housing and cover. The castings are

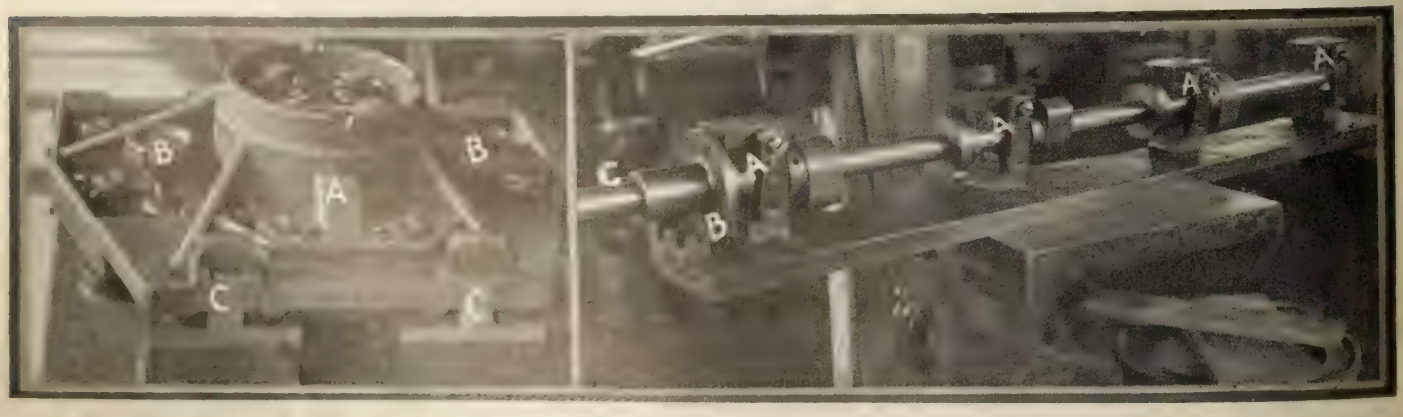


Fig. 5 — Drilling driving gear housing cover.

Fig. 6 — Drilling pin holes in ram.

located by means of pins A, which fit into holes machined in a previous operation. The two straps B are then fastened against the two castings, these holding them firmly in position. The fixture is held to the face plate of the lathe by means of bolts that fit into holes in the face plate, also, the holes C of the fixture. When the tool is in position the large hole D which is 2-11/16 inch diameter is bored, and the end faced off squarely. This operation is standard machine shop practice and needs no further description.

Fig. 5 shows the jig used when drilling the camshaft driving gear housing cover. The casting has been previously milled on the parting line surface and is located in the jig by being pushed back against stop pins at the rear. Guide pins are also provided on each side, the casting passing between them dropped down the knob screws B, are tightened down onto the piece and hold it firmly in position. It will be noticed that the tool is arranged with steel tongues C, and when the cover drops down these fit into machined slots thus locating the two elements of the tool in the proper alignment. The following holes are then machined; nine 17-64 two 5-16; and four 1-4 inch, these latter holes being afterwards tapped with 5-16 in. taps. The jig is provided with guide bushings for each hole.

Machining the Camshafts, Drilling and Grinding

The common practice of automobile companies when machining a camshaft is to make the cams integral with the shaft, these being ground from the rough forging. This concern however makes the various cams separate from the shaft, the reason being that when any cam is badly worn and requires replacing, it is much cheaper to make a single unit than to purchase an entire camshaft.

Fig. 6 shows the fixture used when setting up the cams and camshaft for drilling also the pin holes that hold them in their correct positions. The shaft is held in supports A, and an index dial B is fastened by means of a set screw at the forward end. The various cams have been previously slid onto the shaft, and each cam is marked with an index line that passes through its central section of the large diameter. to hold the cam from moving.

The man then places this index line central with the center of the shaft by using a height gauge. A headless set screw is next tightened which passes with the shaft, this being used merely and first cam aroung a certain number of degrees as desired by the particular engine design, this being performed with the index pin C, fitting into the correct hole in the index plate B. The second cam is then lined up by means of the height guage and index line on

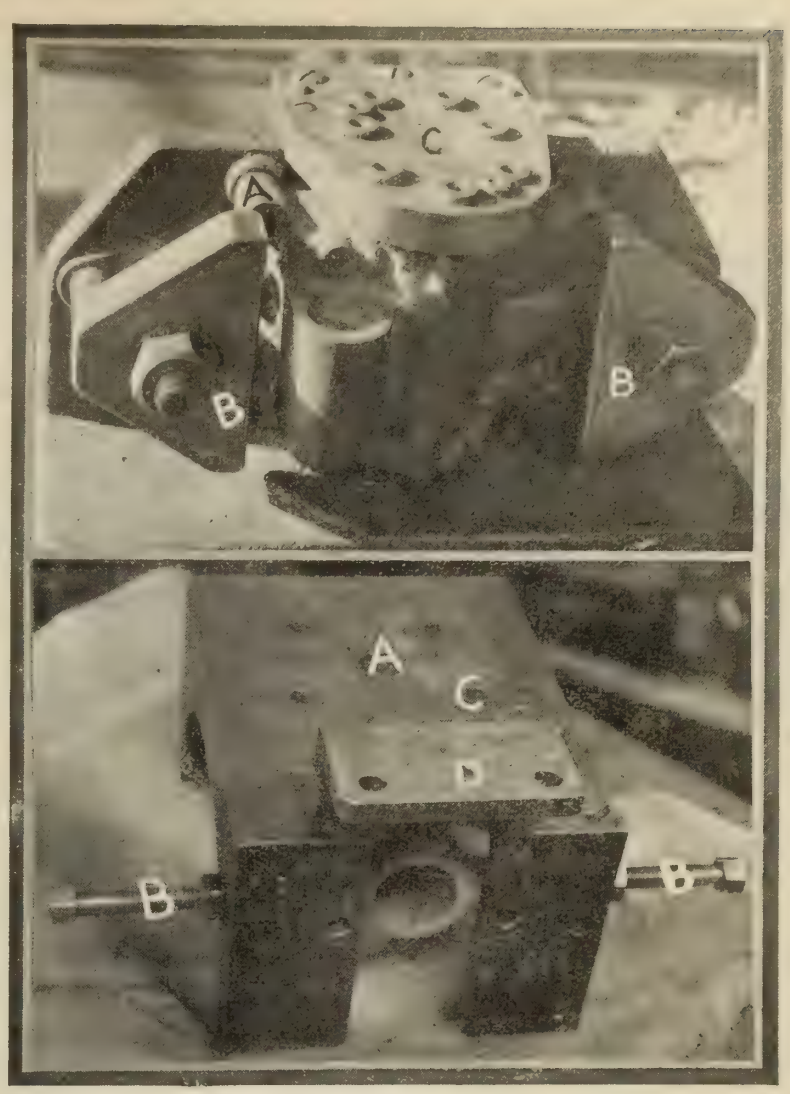

Fig. 9 — Drilling small holes in pump body.
Fig. 10 — Drilling inlet valve body.

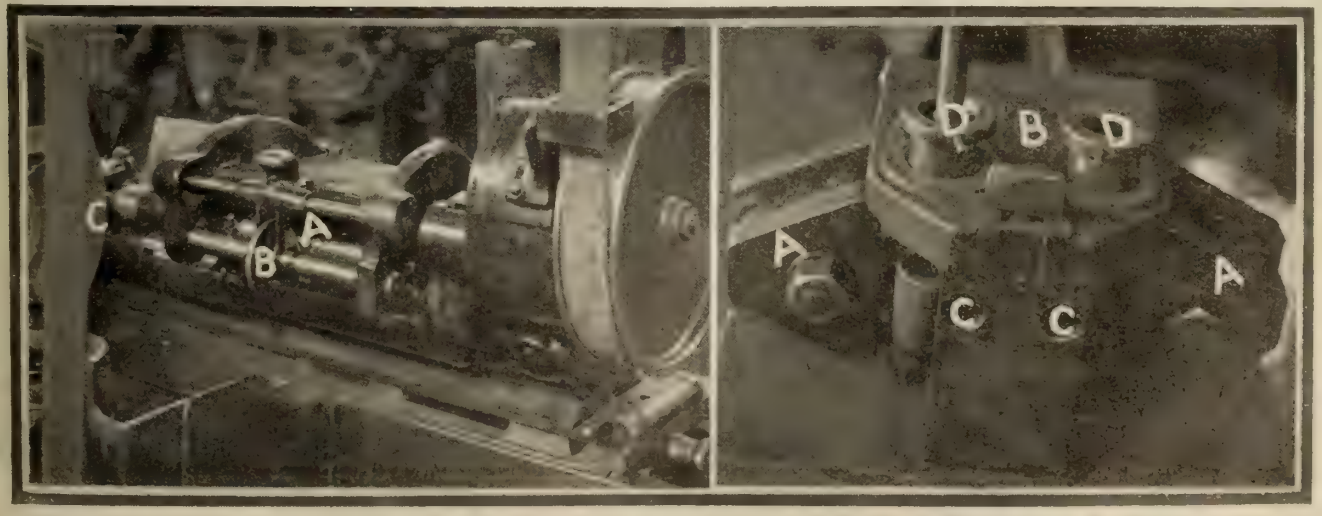

Fig. 7 — Grinding the cams.

Fig. 8 — Machining large holes in oil pump body.

the cam surface as previously noted, and when the cam is in the correct alignment it is pinned in a manner similar to that already described. A similar procedure is followed until all cams have been located on the shaft the distance between the various cams being easily determined by means of a scale. It can be easily seen that this method is accurate as it leaves nothing to guess work, being similar to indexing on a milling machine. However any slight discrepancies which might occur are removed in the next operation which is grinding and will be next described.

The machine used when grinding the cams on the shaft is illustrated in Fig. 7. The shaft is carried on centers and driven by a dog which is common practice for grinding operations. The high place on the cam is first placed in the same plane as the large diameter on the cam former A. The machine is now started and as the revolving guide roller B, comes in contact with the former A, the shaft is forced outward a similar distance. The shaft is then fed against the revolving wheel C, and the cam is accurately ground with a similar contour to that of the former. It might be added that the former is made of two different diameters the first roughing out, and the second finishing, thus not only producing a smoother contour, but also avoiding any resetting as when the shaft has been once set as regards contact with the wheel a number may be ground before feeding in, or until the wheel has worn perceptibly. The next cam is now set as noted and the operation repeated until all cams have been correctly ground. They are then tested by means of micrometers and gauges.

Machining the Oil Pump Body

Fig. 8 shows the jig used when machining the large holes in the oil pump body. The casting is located in the tool by means of two pins that fit into holes drilled and reamed in a previous operation. The two clamps A, are now fastened against the element by means of the bolts and screws as shown to hold it in position. The clamp B, is then dropped down and this it will be noticed is located with a tongue to obtain the correct alignment. The latch bolt being fastened, holds the cover down onto the piece. The importance of this tongue is apparent when it is noticed that the guide bushings are in the cover. Two holes are now drilled to 29-64 inch, using the hole C, to guide the 15-16 inch, using the boring bars D, guided through the bushings shown.

The jig used to drill the small holes in the oil pump body is illustrated in Fig. 9. The casting is again located by means of pins A, these fitting into machined holes. The strap B tightened onto the piece with nuts and bolts to hold it securely. It might be added that the casting has been also machined on the parting or joint face, so that the element rests against a smooth outline. The following holes are next machined; seven No. 3, and two No. 31 drill sizes, the various bushings in the plate C, guiding the drills.

The remaining illustration, Fig. 10, shows the jig employed when drilling the inlet valve body. The casting is located on a large plug at A, that fits into a hole which has been bored in a previous operation. The joint surface has also been machined in a milling machine to obtain a smooth contour. The two screws B, are then adjusted against the casting until the ears of the element are central so that the holes drilled will be in the best location as regards appearance. Four 29-64 inch holes through the bushings in portion D. This tool may appear somewhat of a makeshift design but was found advisable and has proved well worth the cost of manufacture. Readers will notice that much thought has been put in the design of these various tools and the result is that the elements produced are not only interchangeable in their nature but are obtained at a much lower initial cost.

THE USE AND ABUSE OF WEDGES

By WALTER ROWLANDS

(Continued from page 29)

first on account of the very close inspection limits allowed, but these never was any trouble. The whole arrangement was the means of turning out considerably more work with less help and needless to say when the proper appliances are furnished the average man, he will take more interest in and do far better work for his employer.

The inspection limits on this frame averaged 1-16 in., with some parts closer. This is considered close work for common bar material. In the various members, some of which had 90 degree bends to go between the side members, these were punched hot, the same heat as the bending operation. The writer however intended changing this hot punching operation and doing the job on an ordinary punch press, having two holes or trenches in the floor at the base of press, thus being able to punch two members at one time.

In summing up the subject of the use and abuse of wedges, the writer believes that the principle of a buck with carriage arrangement as described can be used to very great advantage for a large number of riveting or assembling jobs when made in considerable quantities with close competition.

LOOKING TO THE FUTURE

Some support for the predictions being made by busines men that an improvement in business is to be expected in 1922 was given by Roger W. Babson, head of the Babson Statistical Organization in a recent address in Montreal. On this occasion Mr. Babson outlined twelve periods which he claimed formed a business cycle. He showed how the country had experienced three such cycles, each requiring about fifty years to complete. In these cyles commodity prices rise for about twenty years and decline for thirty years. The twelve periods are as follows;—

1. The peak of prosperity, large profits, high wages; 2. Period of inefficiency, declining bond prices; 3. Period of dishonesty and profiteering, declining stock prices; 4. Periodical crime wave, declining commodity prices; 5. Lack of confidence resulting in unemployment; 6. Decline in real estate due to curtailment of living expenses and doubling up of families. This ends the general decline and improvement commences. 7. Thrift more evident, declining interest rates, banks loan money for building, 8. Greater efficiency in labor due to unemployment, increasing bond prices. 9. Fairer prices existing. Dollar reaches normal buying value. 10. Renewed religious interest, improved confidence, greater buying with firming of commodity prices. 11. Greater activity in all lines, labor fully employed. 12 Extravagance again in evidence, high interest rates. Cycle is completed.

It was the opinion of the speaker that we are now entering the sixth period and that the rapidity of recovery would depend upon districts and trades, those trades that were affected the earliest being the first to recover.

PAINT SPRAYING MACHINES

Tests carried out on paint-spraying machines have shown that spraying requires approximately 10% more paint than brushing when the surface being treated is an iron roof, while brushing requires approximately 200% more labor than spraying. Exterior brick wall spraying requires 7% more paint than brushing, while brushing requires 109% more labor than spraying. On interior ceilings and walls of plaster spraying requires 40% more paint than brushing, but gives a better hiding in one coat. On similar work brushing requires 160% more labor than spraying, and gives a poorer hiding in one coat. Although it has not been possible as yet to arrive at a definite conclusion confirming the relative durability of spraying as compared with hand painting, it is claimed that the investigations so far made tend to support the belief that the spraying work will last longer. —Mechanical World.

TESTING TIRED METALS

It has been known for some time that metals are like human beings in getting tired after a prolonged exertion. A piece of metal, for instance, which is subject to constant vibration will gradually lose its strength, but will recover it again if it is allowed to remain quiet. Engineers, therefore, attach great importance to what is called the "fatigue testing" of metals. Previously such a test took considerable time, but with up-to-date apparatus, it can be done in a few minutes.

Methods of Reducing Fatigue in the Tool Rooms

Conveniently Placed Shelves and Drawers—Orderly Arrangement of Tools—White Surfaces Improve Conditions—Shelves Should Not Be too High—Sunlight is Important

By F. B. and L. M. GILBRETH

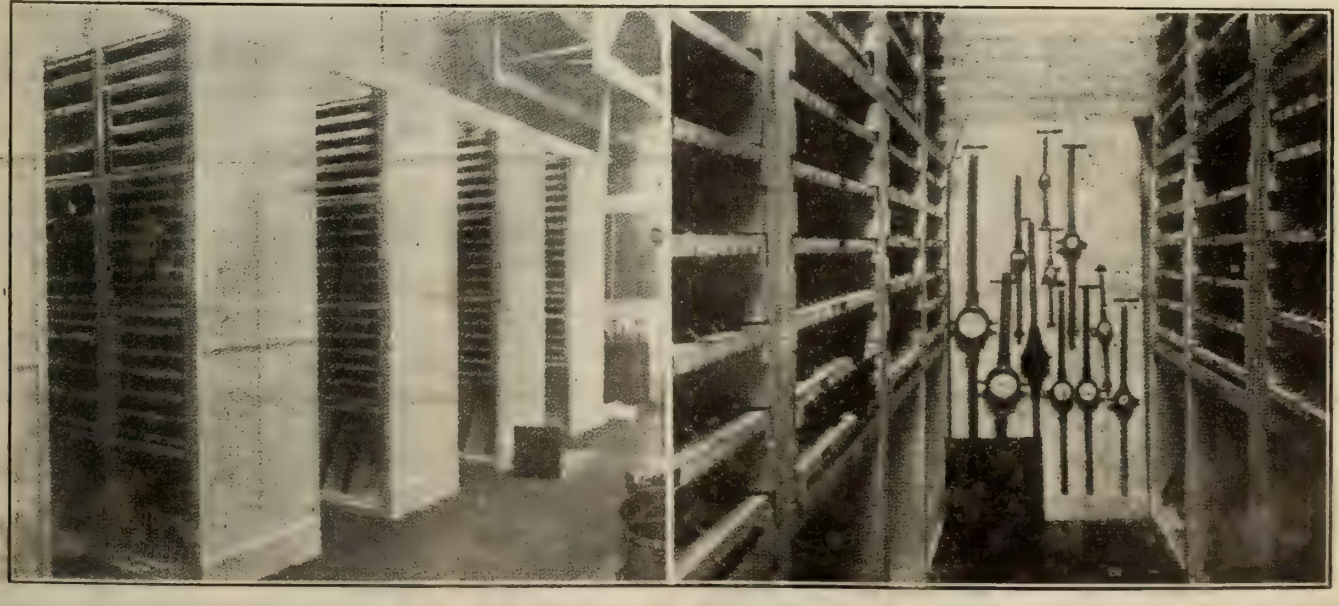
ELIMINATING unnecessary fatigue in industrial plants is assuming more and more importance and many plant executives are beginning to realize that investigations carried on for the purpose of correcting conditions which contribute to fatigue, are productive of worth while results. The by-products of fatigue study invariably are worth as much as the direct benefits, yet the latter are sufficiently impressive to amply justify the effort expended.

Fatigue study is a first step in motion study and is so closely allied and interwoven with accident prevention that for best results each must be considered in relation to the other. Fatigue study also is related to personnel problems and the reduction of absence and labor turnover; it solves intensive output problems and leads to proper lighting and a better quality of resulting workmanship. Many more examples could be cited, but they all emphasize that fatigue study cannot be properly considered alone. Its by-products alone warrant its intensive application.

Tool Room Ideal for Observation

The tool room offers an unusually good opportunity for the investigation of fatigue problems. It is more or less common to all workmen, enlists the interest of all, and anyone can be taken to see what has been accomplished there without any possible misunderstanding being aroused. Having witnessed a new method in the tool room, employees can adapt it to their own activities.

From a paper presented at the annual fall meeting of the Society of Industrial Engineers, Springfield, Mass., Oct. 5-7, 1921. The authors are consulting engineers, Frank B. Gilbreth, Inc., Montclair, N.J.



Another view showing value of sliding shelves

The tool room, part of which is shown in the accompanying illustrations, was especially designed, and every advantage possible has been taken of the available daylight. The aisles are laid out so that all daylight can be utilized and the best artificial lighting provided. The switches or buttons for turning on and off the light are located so that the person using the light can put it on with the least expenditure of effort possible, on entering an aisle, and switch it off just as conveniently when leaving. There is a standard location as well as position for the light switch which eliminates as far as intensive standardization can the effort of "search," "find," "select" and "grasp." As in all other motion study work, we considered here the 16 subdivisions of the motions in designing the tool room, placing the switches, and working out other details. Great effort was made to place the tools no higher than was necessary. The available amount of space was calculated, and no shelves or other equipment for holding tools were placed any higher than was absolutely requisite for holding the supply necessary at the time. However, provision was made for an unexpected excess in alphabetical order of the tool symbols in case such unexpected excess should occur. This eliminated unnecessary reaching and also accidents that might have occurred from the falling of tools.

The tool room was especially design-

Adapting Machine Tool Plants to Slack Times

Although No Special Plan Is Suggested, Many Hints of Value Are Embodied—In Making Special Machinery Certain Things Must Be Avoided

By H. L. FLATHER

SPEAKING before the New York meeting of the National Machine Tool Builders' Association recently, H. L. Flather, who is treasurer of Flather & Co., Inc., Nashua, N. H., brought out some interesting points as to how machine tool plants could adapt themselves to slack times.

"Some thirty-five or forty years ago when I was a boy," he said, "I spent an occasional vacation with an uncle on a farm. Now while this uncle was one of those men whom children love to visit, he was not what others would call successful, especially in his line of work. In fact, he had all he could do to make a living. However, regardless of his faults, he possessed one faculty or talent, and that was, the ability to see and point out the mistakes of his fellow farmers. He could show, theoretically at least, their every fault, and also how if they would only follow his advice they could not help but be successful. Some of my friends who know me best have at various times intimated that I resemble my uncle in some respects.

"If anyone expects me to divulge a plan that will change an idle shop into a busy one, I am afraid they will be disappointed. After careful thought I have concluded that about all I can do it to copy my uncle and point out the faults and mistakes, as they appear to me, of what has been done in the past, not only by our company, but by some others with whom I have been more or less acquainted, hoping that by taking the negative side that something may develop that will be of real benefit to the machine tool manufacturers in times like the present.

"My first experience with a business depression came in 1893 and I haven't missed one since. I also feel more or less acquainted with the depression of the seventies through hearing it talked over and discussed by the founders of our company. On account of the many hardships endured and the ways and means used to keep our company in existence, the panic of the seventies was ever a live topic in our family, and although there were only about six lathe manufacturers at that time, the problem of how to keep alive was just as serious then, possibly more so, as it is today. The same difficulties existed then as now, so there is in reality nothing new to face, except to find a better way of overcoming them, and it is regarding these that I have theories of what we as manufacturers should and should not do. You will notice I say theories, because after having been actively engaged in making machine tools for over thirty years, I only know two things, the rest is all theory. The two things referred to, are, first—that in dull times it is next to impossible to make money, and second—you can make a tremendous loss unless the greatest care and foresight are exercised.

"Speaking for my own company, I can say that in the past we have done about everything to keep the wheels moving. Some years ago our company purchased from a manufacturer located in a small city some distance away, a single purpose machine and I was sent there to learn to operate it. Not knowing anything about hotel accommodations, inquiry was made of a friend who traveled that territory as to which was the best one, and he replied, 'There are six but whichever one you go to you will wish you had gone to the other,' and it is the same way with dull times, whatever we do we wish we had done something else. We have run on short time with practically a full crew, we have run full time with a reduced crew, and we have shut down entirely. We have built up stock when we wished we had not and we have kept our money in the bank when we wished we had it in stock.

"We have made an endless number of mechanical contrivances, including the first type of bicycle, familiarly known as the "bone-shaker," have made many patented articles, including flat-irons, horse shoes, even jack-knives with a blade for every conceivable use, designed many original machines for special purposes and also built them from designs furnished us, but I think without exception that in the long run each venture was a mistake and money loser. In all such cases a great deal of time and energy must necessarily be consumed which can not be acounted for in preparing to manufacture something greatly dis-similar to one's regular line, and unless the manufacturer is exceptionally fortunate in having executives of unusual ability, the probabilities are that many of the ways first tried to produce the new product will not be successful, necessitating starting over again, at least once, if not more times. If it were possible to use the same energy and ability in improving one's regular line, the financial benefit would be much greater.

Special Machinery

"Many manufacturers take on special machinery and sometimes this works out to advantage, other times, not. I will cite two examples, one of which was a success, the other a failure. For a successful example I have in mind a manufacturer who commenced years ago to make some special machinery used in a food industry and due to a combination of unusual circumstances has made a success of this business; first, owing to a universal and constantly increasing market for this particular food, the demand for this special machinery is practically constant, and second—to being located where he has no competition. In this one case the side line has outgrown the original. The tail has wagged the dog. On the other hand, I know of instances where the building of special machinery has lost to manufacturers business in their regular line, because the machines have not come up to the customer's expectations and regardless of the fact that they were not at fault the machine tool builder was held responsible. It is needless to add that in such cases the manufacturer would never again receive from such customers consideration in the placing of future business, either for standard or special machines. My unsuccessful example is that of a machine tool builder who by hard work had established himself a fairly good name for his particular line when one of these depression cycles swept over the country. Not being any too strong financially, it was necessary for him to keep his shop in operation if possible. A plausible inventor happened along about this time and the shop owner was persuaded to undertake to manufacture a machine which, according to the inventor, would revolutionize a certain industry. As is usual in nine out of ten of these cases, the machine turned out to be fundamentally wrong in design and became a failure. Nevertheless the builder was blamed by the inventor, payment was withheld and a long law suit resulted.

"Eventually the machine tool builder won the law suit but it practically cost him his business for these reasons. During the time the law suit was on he had to neglect his regular line. Meanwhile normal conditions returned in the machine tool business and he was unprepared to take care of his agents and customers and by the time he was, they had gone elsewhere. Further, when he came to the actual manufacture of the special machine he found that his regular machinists were not adapted to new work and he had to hire some that were, and by the same token, when he returned to making his regular line he had to change once more, and his old men having found positions elsewhere, it was with great difficulty that a new set of competent men was secured. The final result was that although the machine

tool builder recovered the cost of the special machines, the amount did not offset his losss in other directions and he became financially embarrassed and forced to liquidate.

In considering these two cases the critic may say that success or failure was simply a matter of foresight and business sagacity, but I do not think that is the correct answer, because I happen to know that in the case of the successful manufacturer the special machinery was taken on simply to tide over during a slack time and the future expansion was not in any way due to ability or foresightedness. In the case of the manufacturer who failed I also happened to know that he did not depend on his own judgment but sought the advice of others. The consensus of opinion of them all was that the invention apparently had great possibilities and if it made good there was a fortune in it. Some may even reason that it is best to distribute your eggs among many baskets, but personally I agree with Mark Twain who said, "Put all your eggs in one basket, but watch that basket." If you once decide to make machine tools stick to them.

Unprofitable Work

My own conclusion is that doing work foreign to one's regular line is unprofitable. There is, however, one exception which I wish to make and that is, the taking on of comparatively simple work, requiring little or no supervision, at a fixed rate per hour. This enables a manufacturer to keep his organization together and cuts down the overhead. The fly in the ointment in this proposition is to first obtain the business. In dull times there is very little of it to be had and what there is, is most generally given to contract or job shops who make a specialty of doing this work in good times and bad. Still, our firm has always been able to secure some and in thinking the matter over, I recall that most of this kind of outside work has been confined to planing. Such being the case, I would suggest that our members look into this and see if they cannot develop something locally, especially those who have unusual planer equipment, such as exceptionally long or wide planers. Because of our firm happening to have an extra wide planer we were able recently to secure on an hourly basis some work right in our own city that amounted to about two thousand dollars.

Every depression occurring in my generation has been brought about by a different cause; over-speculation, politics and the world war all playing their part, and no two depressions have come about from the same cause, so that the lessons we learn from one cannot be applied to another. If the present depression were caused by the same conditions as the one of 1893, or if the next one will be the result of the world war, I am sure we could apply to advantage the knowledge gained in the past, but as each depression was the result of entirely different causes, the lesson we learned in '93 is of very little value now.

You may think that I am straying from my subject, and perhaps I am, but the point I am trying to bring out is what we should do with idle shops in dull times depends a great deal on the cause of dull times. For example, if world conditions today were similar to those existing in '94 and '95, I should advocate running our plant to capacity and stocking, if necessary, all the machines we could make. On the other hand, if there should be another world war and I am unfortunate enough to be alive at that time, I should commence to curtail with the first rumors of peace and not stock a single machine.

As I said earlier in this article, my actual knowledge of what can be made to advantage in a machine tool shop during slack times is very limited, my experience has grown only a crop of theories. I do think, however, that if you take on outside work or special machinery, it is much better to confine the new work as closely as possible to the line in which you are already engaged. Sometimes, even what seems like a small change from the regular, will cause a lot of trouble, as perhaps the following illustration will show.

During a semi-slack period some years ago a firm in a nearby city placed their order with us for what seemed to be nothing more than an ordinary lathe with a turret on the ways and another on the carriage, it being thought by all that a machine of this kind would handle a certain part to perfection. After the machine itself was made the job of tooling it up and testing it out was given to me. Of all the deceitful things which I ever encountered, that piece of work was the limit. I worked on the job for months until I fairly hated the very sight of it. Finally we hit upon a new scheme for tooling the work up and by hard work I finished the tools the night before I left on a vacation, sure in my own mind that they would be a success. Upon my return, almost the first words my father said were, "Son, I am glad you are back, those last tools didn't work and the machine is waiting for you to try something else." Eventually, after we had spent in experimenting several times the original price, the machine was accepted and we charged the loss up to experience. Having expounded my theories regarding what shouldn't be done in slack times, possibly you are wondering if I have any theory as to what should be. I have one, but I hesitate to tell it, as it may be thought idealistic and visionary.

To operate a shop successfully in dull times you must be able to do so in good times. That statement may sound like pure nonsense at first, but before passing judgment let's analyze it for a moment. What constitutes successful operation? Does the mere ability to secure orders sufficient to make a profit when business is good constitute successful operation? I claim that that is only partial success. We all know without my going into the whys and wherefores that the machine tool business can be operated at full capacity only at certain periods or intervals of more or less duration. That every so often we are confronted with a cycle of depression, caused by conditions beyond our control. That in spite of ours being a fundamental industry, the one in fact, on which the world today is dependent as it is on no other, yet it is also a fact that what profits there are, are only made during good times, and to make ends meet at others it is necessary to resort to extreme measures.

My theory is that the price at which machine tools are sold when there is a market should be sufficient to return a profit great enough to pay a reasonable dividend annually, good times and bad, on the capital invested, and in addition take care of the ordinary expenses during the dull times. Hence my idea of operating a shop successfully in good times is to see that we obtain that price, and if we do, we shan't have to worry so much about the dull times.

METHODS OF REDUCING FATIGUE IN THE TOOL ROOMS

Continued from page 33

ed along lines of combining efforts on fatigue elimination and safety work, or accident elimination and sufficient lighting to insure tools in the best condition with least effort of inspection. It was found that fatigue and safety work could be carried on at the same time with no extra expenditure of money and energy.

Tool Room Painted White

Every possible surface in the tool room is painted white, as the illustrations show. Tools are arranged in the most orderly manner possible. This was done in accordance with a predetermined standardization, the theory and practice of which had been a gradual growth, before, through and after the experience of F. W. Taylor, and finally as a result of micromotion study of the accepted traditions and standards of highly standardized tool rooms and tool cribs of modern plants. The result, as was to be expected, emphasized that the motion study and fatigue study cannot be separated, and to omit the full consideration of either one reduces the final quality of the results of the other.

Sliding trays are used where possible for certain tools, so that workmen can examine each piece without disturbing the others. The packet principle was incorporated, and the tools are placed in such position that they can be handled with least amount of fatigue and greatest safety. The ladders used have steps which project inside to allow the foot to have a firm and comfortable position and the shin to touch upon the outside nosing of the step above, thus eliminating fatigue and accidents.

White paint is only one factor in the reduction of necessary fatigue and accidents in tool rooms, but it is the outstanding feature to the casual visitor and is the emphasized feature in tool room shown in the illustrations.

Industrial Diamonds—Their Pedigree Essential

Little Thought is Given by Operator Engaged in Trueing Wheel As to Work Entailed Before An Industrial Diamond Becomes Fit For Use—Interesting Service Plan

WHEN an emery wheel operator, say, in a motor car plant, is engaged in the trueing or dressing of a wheel by means of a diamond tool, very little thought enters his head as to the amount of service which the little implement represents before it actually comes to his hand. Nor is he aware that the complete history, grade and purpose of the stone set therein has become a matter of analytical record. This record or pedigree has come to be regarded as so essential in the marketing of diamonds of this class, that manufacturers today should know not only the exact cost per dressing but the details as to the actual life of a diamond of given quality.

In analyzing diamond service, the Wheel Trueing Tool Co., Detroit and Windsor, for example, have developed a record system in which as direct diamond importers and tool workers they may be said to keep in constant contact with their industrial diamonds—from the cradle to the grave. Not only is every stone a matter of careful record—how mounted, when used, and of what grade—but a table of comparative costs per dressing has been worked out. Pointing to the thoroughness that has been developed by this particular company as an object worthy of ambition in any business, and as a potent factor in advertising and selling, Printers' Ink further reviews some interesting facts relative to industrial diamonds. Here is what they say:

"Industrial diamonds come out of the same mines as those cut for gems. The diamond is a natural formation and is found in river beds, on the surface and in mines to a depth equalling approximately that of any mineral deposit. Between 90 and 95 per cent. of all diamonds come, in normal times, from South Africa.

"Diamonds are mined, primarily, for the purpose of securing stones suitable for cutting into gems. The by-product, which is given the general name of Bortz, is the grade obtained after sorting for gems, generally after six sortings. For the purpose of this article we will consider that Bortz is the synonym for industrial diamonds, or diamonds not suitable for cutting into gems. Bortz is divided into many classes, the principal one being enumerated as follows: Names describing color: white, grey, black, light brown, brown, dark brown, canary yellow, pink and green. Names describing quality: Perfect selected, finest and fine. Names describing shapes: Octahedrons, rounds, flats, ballas, irregulars and cleavages. Names describing classifications and purposes for which used:

"Crushing Bort (which is crushed into diamond dust and used for lapping purposes), Saw Bort (stones from which saw teeth are made and which are used for sawing stone and marble. Drilling Bort (used in rock drills for mining purposes, Glaziers (used for cutting and etching glass), Splints (sharp, pointed splints of diamond used for small drills, for turning jewels for watches, engine turning, engraving, etc.), Slabs (for making shaped turning tools), Flats (the crystals or parts of crystals into which holes are bored so that they can be used as dies for wire-drawing work), Tool Borts (which are set in holders and used for trueing grinding wheels).

"Brown, grey, and black borts, which are further subdivided by the terms "Selected," "Finest," etc., are very hard stones, but are apt to shatter if not properly set in the holders, due to the fact that there are very distinct cleavage lines in their structure. These stones are very frequently found in the natural state in the form of octahedrons and many users insist on this shape when purchasing stones, as it is considered that a more positive grip may be obtained in the setting.

A Job For a Service Department.

"These diamonds are found in many shapes, variations of the octahedron and in squares and flat triangular form. Some claim that the stone having the greatest number of sharp points will give the most service. Others argue that the round or Ballas-shaped stone will give far greater service if frequently reset, as the points of an octahedron wear down very rapidly, causing a greater reduction in weight for the amount of work accomplished.

"The Ballas differ from other stones in their formation in that there is no direct cleavage line to be found in them, the crystals being built up around the centre and following no regular lines of formation, resulting in an irregular, knotty stone which is hard and tough. As there is a vast difference in industrial diamonds, so, too, there is equal complexity in the selection of diamond tools. Unless used as diamond dust for a grinding or lapping agent all industrial diamonds must be mounted in a tool to perform the function for which they are purchased. The design of diamond tools is a science, the mounting of diamonds in these tools is an art.

"Assume the position of a buyer of industrial diamonds, diamond tools, or both. It is quite out of the question to consider that this buyer can study the quality of diamonds or the value of diamond tools to the extent that he is an absolutely competent purchaser. He must rely on the advice of those who do know in order to buy with greatest economy. This condition holds true of the majority of the diamond buyers in the country.

"Thus it is a logical thing for this company to advertise service since it has something to sell far more important than diamonds and tools—a service with a foundation of most economical diamond use for all of its consumers.

"Most industrial diamonds look alike to the untrained diamond man. Consequently, the industry presents opportunity for selling inferior diamonds at a low price, just to get the business. Minimum cost per dressing is the only guarantee given with diamonds or diamond tools. However, it is an all inclusive guarantee. If the stone is too small for its work the cost of dressing will be too high. The same is true if the stone is of the wrong grade, is defective, or is in an incorrect mounting or tool.

"Yet another angle which ties up the service argument is the fact that diamonds wear away in use. These stones may be relapped and reset—the delicate work of diamond experts. Each reset diamond is reweighed and the tool stamped with the weight of last resetting. This permits the cost department of the factory to inventory the diamonds and determine their shrinkage in value by wear at a glance."

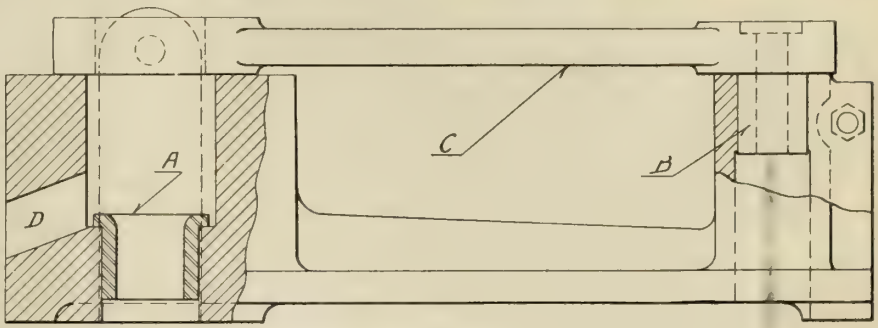
60 TON HOPPER BOTTOM BOX CARS

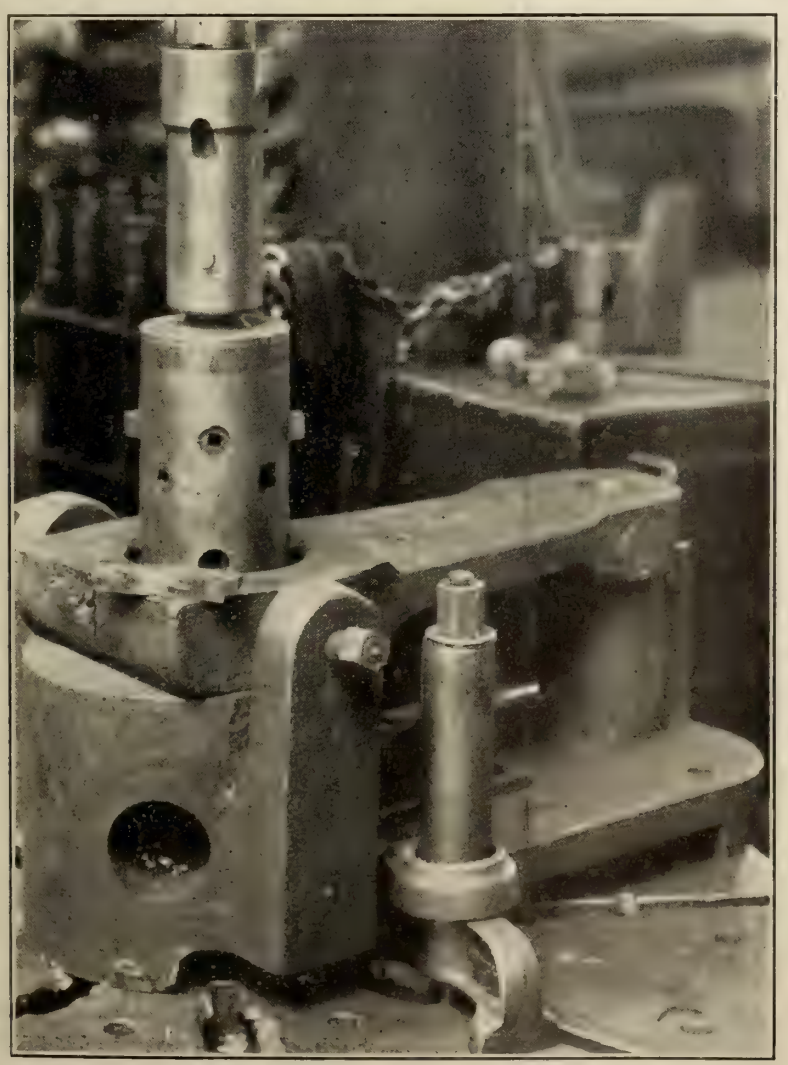
(Continued from page 28)

entire arrangement is located overhanging the end of the roof so that it is impossible, even in the deepest snow, to have it pile up underneath. The ratchet pawl is of the gravity type, and therefore the trainman is not required to use his feet for the purpose of holding the pawl in position. The trucks are of the standard arch bar type with improved truck columns, spring plank and truck column fastenings, pinless brake beam hanger brackets, and four point brake beam suspension.

Brown Copper & Brass Rolling Mills, New Toronto, report improvement in trade conditions as affecting them. Their sales have shown a steady increase each month over the preceding one, and Mr. Brown looks for the new year to bring business back to normal or better.



WHAT OUR READERS THINK AND DO



BORING ON THE DRILLING MACHINE

By J. H. Rodgers

An accurate and time saving jig for boring holes in locomotive crank arms is shown herewith. As will be seen from the illustration the machining operation is performed in an ordinary drill press and very effectively. The jig is self-centering and the boring operation is completed at one setting of the bar. The bar is of special design, carrying roughing, finishing and filleting tools, all being of the expanding type. The roughing tool precedes the finishing tool and the former has completed its work before the latter comes into action. The filleting tool is inserted ofter the bore is finished.

Sectional view of the jig.

Showing the jig in actual operation.

The line drawing shows a sectional view of the holding fixture. The jig is centrally located when the pilot end of the boring bar enters the hardened bushing A, and it is then clamped to the table. The trunnion B on the end of the arm C is inserted in the hole in the outer end of the jig. This end is slotted to provide clamping facilities. When the work is in position the crank pin end is adjusted to equalize the cut in the cored hole, the central distance of the holes remaining constant. Holes D are provided for the escape of cuttings.

HANDY BELT RULES

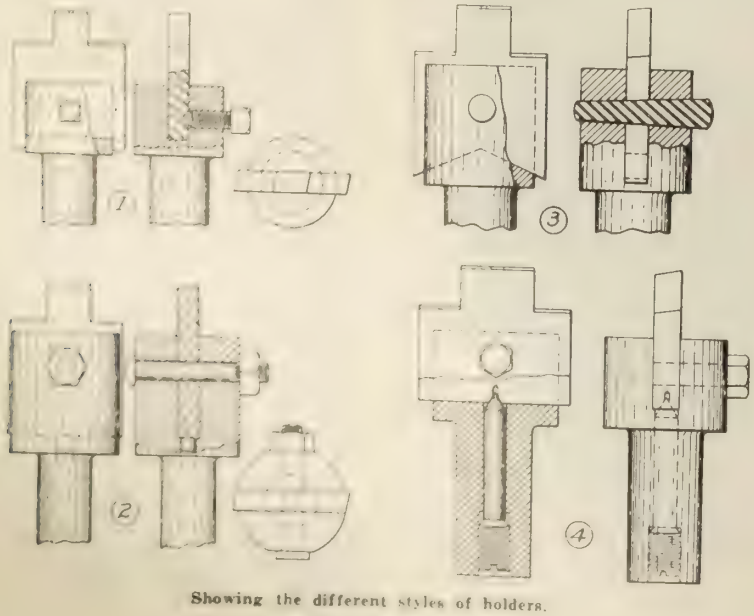
By W. F. Schaphorst

Practical men are always on the lookout for the best and simplest rules. They hate complexity. They prefer simplicity. That is why it is desirable to condense belt rules to as simple a form as possible, do away with formulas entirely and use them as "rules of thumb." For several years past I have made a special study of belts, have collected all manner of data, have investigated the "fancy formulas" developed by scientists, and I always come to the same conclusion—that our simple rules of thumb are usually preferable to the complex formulas, and they are generally safer. Besides, if a belt isn't attended to, if it isn't dressed once in a while and is allowed to get dry, hard and slippery, the best formulas in the world won't keep it on the pulleys and won't stop slip.

I have just finished checking figures in a catalogue of a well-known manufacturer of pulleys. In this catalogue, tables are given which state the horse power transmitted for all sizes of pul-

leys, all speeds and all thicknesses of belts—single, double, triple and four-ply. Each figure is computed separately, taking into account the effect of centrifugal force. And it is assumed that driven and driving pulleys are equal in diameter. I find one thing in my checking which I consider an error, viz, that with increase in speed, a given belt will transmit less power. It has been demonstrated time and again in actual tests that large pulleys and high speeds, up to about a mile a minute, are desirable for most efficient transmission of maximum power. The best leather belts with cemented joints, may be operated to advantage at 6000 ft. per minute.

Basing my conclusions on past personal experience and on present good belting practice, I will say that the following rules of thumb are generally good and safe to use:—For single-ply leather belts, 3-16 inch thick, each inch in width will transmit one-horse power when running at a speed of 800 feet per minute. Pulley should not be less than six inches in diameter. For double-ply belts, 3-8 inch thick, each inch in width will transmit one-horse power when running at a speed of 500 feet per minute. Pulley should not be less than ten inches in diameter.



For triple-ply belts, 9-16 inch thick, each inch in width will transmit one-horse power when running at a speed of 300 per minute, pulley should not be less than three feet in diameter. The four-ply belts, 3-4 in. thick, each inch in width will transmit one-horse power when running at a speed of 300 feet per minute, pulley should not be less than four feet in diameter. The above rules will give very satisfactory service where the belt is kept in good shape. Do not allow the belt to dry or harden. Keep it dressed with a good grade dressing.

HOLDING FLAT CUTTERS

By Harry Moore

The four sketches shown illustrate various ways in which flat cutters can be quickly and conveniently located centrally and firmly held in the holder. Fig. 1 shows rear of cutter cut away so that a short lug on either side fits closely over the diameter of the holder. Set screw point enters countersink inside of cutter, the countersink being located a little forward to force the cutter back against the seat.

Fig. 2 shows a round tit turned on the back of the cutter, said tit fitting into center hole at the bottom of the slot. Bolt pasing through holder clamps cutter securely. Fig. 3 shows cutter wedged on opposed tapers by means of tapered pin, while Fig. 4 shows method of locating cutter by means of center pin, adjusted to position by headless screw.

Showing the different styles of holders.

ANSWER TO THREAD CUTTING

By J. DAVIES

In the Oct. 27th issue of Canadian Machinery, writes J. Davies, I notice an article on thread cutting by Cecil H. Smith, in which he propounds a system of finding gears for thread cutting which, in his opinion, is simpler than the one you published in your issue of August 25, which was written by myself. I believe Mr. Smith's criticism is a friendly one and I know a candid exchange of ideas by your readers on various subjects will be beneficial to all concerned. In looking up the issue of August 25 and referring to article mentioned, I notice this statement the first thing. The ratio of the driving wheels to the driven wheels must be the same as the lead of the screw to be cut is to the lead of the lead screw. It is quite true that this can be expressed by simply putting down, as Mr. Smith suggests, the number of threads per inch in the lead screw as a numerator, and the number of threads in the screw to be cut as a denominator. This expresses as it were, the ratio at first hand. But unfortunately, this has a limited application. Try it out on one of the examples given in article mentioned.

Suppose we want to cut a thread .654 lead with a lead screw 3 threads per inch.

$$\frac{\text{3 numerator}}{\text{? denominator}} = \text{Ratio.}$$

The method shown in your issue of Oct. 27 is a good one for common threads such as are usually found in a workshop, but for all purposes, I think the one under discussion is best as, by using it, any train of gears that is possible can be found. Also metric leads can be cut with an ordinary lead screw or vice versa.

NEW PROCESS

The production of synthetic petrol for fuel purposes has another method to its credit. Prof. Mailhe of the science department of the university of Toulouse, has reported to the French academy of science a process for the extraction of petrol combinations from ordinary plants. The new fluid closely resembles Borneo petrol, which, in the early days of the war, provided the French government with the bases for high explosives, as it contains a large percentage of both benzine and toluene.

Not only can the new petrol be mixed with ordinary alcohol, thereby providing a possible motor fuel, but the cost of production, inasmuch as thousands of common weeds can be used in making it, is very low. Moreover, in the process of manufacture of this petrol an inflammable gas is given off which was said to have produced 20,000 heat calories and which, if captured, would alone pay for the installation of large plants.

NEW TORCH

An improved form of oxy-acetylene torch has been evolved in the French Navy in the process of salving vessels lost during the war. A small bell-shaped vessel surrounds the oxy-acetylene flame, and is kept supplied with compressed air. After the flame is alight, and the stream of compressed air established, the torch may be plunged into water without being extinguished. If by accident the original form of blowpipe was extinguished, it was necessary for the driver to ascend to the air to light it again. A tube containing an alkaline metal and an oxidiser is now attached to the torch, and can be moved to the mouth of the bell. On removing the cap from the end of the tube the chemical action of the water on the mixture produces a flame which relights the torch. The addition has greatly increased the number of underwater uses to which the torch can be put.

E. E. Sawyer, formerly factory manager with Dominion Abrasive Co., Mimico, has been appointed factory manager of the new abrasive factory of J. R.

Welding Hint of Value

SPEAKING on the subject of aluminum welding, a writer in the Journal of Acetylene Welding, says that in welding such work as aluminum crank cases, etc., the following idea can be used to advantage.

He says that oftentimes it is required to weld a large hole, in which case a chill of galvanized iron is provided, backing up the hole and welding against this when filling the hole with aluminum. Galvanized iron is preferable to any other material, such as tin or iron, since it peels away from the aluminum quite readily, and can therefore easily be removed after the weld has been completed. This is undoubtedly due to the zinc content of the galvanizing composition. The chief value of the use of the chill is that it causes the filler to cool and harden prematurely, thereby preventing it from contracting after the weld is finished. It also prevents the heat of the weld from spreading, which might cause the job to crack back. The chill is fastened in place by a wrought-iron scrap, made in the shape of a boiler crab, which arches the hole. A hole is then drilled through the strap and a similar one through the galvanized-iron plate, the two being fastened together by means of a bolt and nut. In making the weld, the metal is first aplied to the inner corners and the space filled up by working toward the center. Just before the center is reached, and when it is impossible to add any more metal without touching the bolt, the strap should be loosened, the bolt removed, and the hole filled with the molten metal. Greater success will obtain if the work is done quickly, handling as large an amount of molten aluminum as possible at a time and covering the entire surface of the galvanized chill in a few minutes. The chill causes the added metal to cool almost as fast as it is connected to the edge of the break. After the weld has been finished and cooled, the chill can be removed by gently prying it away from the weld by means of a cold chisel. The flame of the torch should be kept in motion while performing the work, and should not be pointed toward the weld, but rather across the melting portion; otherwise it is almost certain that the flame will not only injure the metal, but will also burn away the galvanizing if pointed directly toward the weld.

Why Does Iron Rust?

SPEAKING on what it pays to know about "Corrosion," G. A. Van Brunt, in a recent issue of "Factory," says that there are three theories of corrosion, the best of which is the "Electrolytic Theory." In explaining this theory he says that it offers a satisfactory explanation for a greater number of observed facts. He continues:

Ferrous salts, especially in solution or freshly precipitated, are rapidly oxidised in the ferric state by atmospheric oxygen; so that all the electrolytic theory must do is account for the solution of the iron in the first place. According to present views the reactions which take place between different substances in the presence of water are accompanied by certain readjustments of the electrical state of the irons. Thus, when metallic iron is put into a solution of copper sulphate, or blue vitriol, the copper is precipitated in metallic form and the iron goes into solution, the ions of this taking the electrical charge of the copper ions. Chemically, hydrogen behaves like a metal and has a lower solution tension than iron; therefore if we place a strip of iron in a solution containing hydrogen ions, the iron ions will assume an electric charge and the strip will be dissolved, as it was in the copper solution, while the hydrogen will give up its electric charge, changing from the ionic to the atomic condition and escaping as a gas.

It has been shown that iron is slightly soluble in pure water, but if oxygen is not permitted to act on the solution no sign of corrosion can be seen. When it is admitted, however, the red ferric hydroxide soon settles out. A little reflection will show that before iron can rust it must first go into solution, at the same time that hydrogen is set free, and oxygen must be present to oxidize the ferrous salts formed. An exchange of electricity between the reacting ions is therefore demanded and the case may be considered to be one of electrolysis, as the disappearance of a hydrogen ion, the hydrogen going off as gas, means the appearance of a ferrous ion somewhere else. We may consider, then, that corrosion is due to the iron being attacked by hydrogen ions and taken into solution. Since hydrogen is the characteristic ion of acids and hydroxyl that of bases, we should expect acids to stimulate corrosion and alkaline substances to retard it, which is in accord with fact.

Taking a bird's-eye view of corrosion according to the electrolytic theory, we see that it lines up about as follows: When iron and water are in contact a certain amount of the metal goes into solution. Remembering that hydrogen acts like a metal, it is seen that its ions will tend to collect around the negative poles and exchange their electric charges with the iron so that the latter will go into solution and the hydrogen escape as a gas. Ordinarily, however, the concentration of the ions is low and the action proceeds very slowly. Iron goes into solution, nevertheless, as a ferrous salt; the oxygen of the air then acts on the ferrous salts and changes them into the ferric state, in which form they precipitate out as the familiar red rust. And so the process is repeated indefinitely.

A Scientific Institute

ACCORDING to information received, Baron Edmund De Rothschilds, administrator of the Eastern Railway of France, has given ten million francs to found a scientific institute, the object of which is to encourage students to take up research as a career. Particular attention is to be given to researches looking to the application of science to industry and agriculture. The institution is to be managed by a council, two members of which are elected by the Academy of Science and the French Museum.

DEVELOPMENTS IN SHOP EQUIPMENT

ADJUSTABLE BED PUNCHING PRESS

A punching press designed for work requiring a long stroke and an unusual height between the bed and the ram, has recently been placed on the market by Ferracute Machine Co., Bridgeton, N.J. The machine is equipped with a bed that is adjustable vertically. As the bed and frame are separate castings it is necessary that their connection be strong and rigid. To obtain this condition, the bed is attached to the frame by heavy steel bolts and the bed is supported on a steel adjusting screw four inches in diameter. A projection on the back of the bed fits into a planed vertical guide in the frame, and keeps the top of the bed parallel with the bottom surface of the ram. The press may also be used for horning operations by inserting a horn in a 9 1-2 inch hole in the frame. The bed is hinged on a vertical rod at the left-hand side of the machine, which enables it to be swung out of the way when the machine is used for horning. The ram has a maximum adjustment of three inches, and the bed nine inches.

The distance between the bed and the ram when the former is adjusted to its lower position, and the ram is at the top of its stroke and its highest adjustment, is 30 inches. The ram stroke is 8 inches. The press exerts a pressure of 70 tons and its weight is approximately 13,200 lbs.

BENCH HAND MILLING MACHINE

The Pratt & Whitney Co., Hartford, Conn., have added another machine to their line of hand millers. It is known as the No. 3 hand miller. The spindle and draw back are identical with that provided on their No. 3 bench lathe. Therefore all spindle attachments on these machines are interchangeable. The table of the milling machine is of a design suitable for the mounting of attachments, and it accommodates head stock and tail stock of the No. 3 bench lathe. All screws are equipped with micrometer dials graduated to 0.001 inch. The spindle is of tool steel hardened and ground, and has a conical front end. The front spindle bearing has a double taper and is also made of tool steel hardened and ground The rear spindle bearing is of "Non-Gran." Both bearings are adjustable for wear A three step cone drives the spindle. The special equipment that can be furnished with this machine includes a swivel vise graduated in degrees, an index quill centre, a tail stock, arbors for saws, a right angle adapter, and a vertical milling attachment. The latter attachment is mounted over the spindle nose and is driven by a plug placed in a draw-in collet.

HEAT-TREATING FURNACE

An automatic heat-treating furnace of the conveyor type has been placed on the market by Alcorn Blockhouse & Co., Philadelphia, Pa. The furnace is designed to handle such articles as crank shafts, cam shafts, automobile rear axles, and miscellaneous small pieces such as gears. The conveyor has a vertical motion and such pieces as crank shafts, etc., are revolved while undergoing treatment. The important advantages claimed are uniform heating of the pieces and the elimination of skilled labor, also an increase in fuel economy and a lowered cost of upkeep. The length of treatment is automatically controlled by means of a variable speed motor that operates the conveyor. The temperatures are controlled by Leeds and Northrup instruments, which includes a temperature recorder. The furnace can be heated by electricity, gas, oil, coal, or any kind of fuel that will give the necessary heat.

VERTICAL SHAPER ATTACHMENT.

Mr. L. E. Rhodes of Hartford, Conn., has developed a vertical attachment that can be quickly applied to any of the standard types of crank shapers, and which will enable operations usually performed on shapers of the vertical type to be performed on horizontal shapers. The housing which contains the vertical ram and its necessary mechanical parts is made to fit in the ways of the regular horizontal ram. This housing is capable of adjustment to the desired position with reference to the work and held in that position by the regular gibs. The installation of the attachment is very simple. All that is necessary is to remove the driving arm and attach two steel leg plates that remain on the machine permanently, screw in a connecting rod and insert a pin. This attachment is also provided with a rotary work table equipped with standard index plates.

QUICK-CHANGE-GEAR ENGINE

The South Bend Lathe Works, South Bend, Indiana, have introduced a new lathe which is made in eight sizes, ranging from nine inches to twenty-four inches swing. These machines can be equipped with either of two types of bed, the straight or the gap. The quick change gear box is the same as that provided on Flather lathes, and has 48 changes of feeds and threads. It has been arranged so that all these beds are available for the cross-feed. The gears are made of steel forgings. The changes in feed are operated through a plunger and index plate and the crank lever above the box which operates an inside clutch.

Three V's and one flat-way are provided, for guiding the head stock, tail stock, and carriage. The spindle is hollow, made of special steel and accurately ground. The headstock is provided with an improved reverse. The tail stock is offset to allow compound rest to be swung around parallel with the axis of the bed. Tail stock is also arranged with a set-over to permit of taper turning. The tail stock centre is self-ejecting. The carriage is equipped with T slots for clamping work to be bored or milled. Both the automatic cross feed and automatic longitudinal feed of the carriage are operated from the front of the apron. Only one of these two feeds, however, can be engaged at one time. Both feeds are driven by a splined screw and worm, so that it is only necessary to use the leadscrew thread, when cutting threads. The compound rest is graduated to 180 degrees, and the cross feed screw has a micrometer graduated collar reading to 0.001 inch. The lathe is sold with the following regular equipment, large face plate, small face plate, graduated compound rest, follow rest (on all but 9-inch and 11-inch sizes) adjustable stop for thread cutting, semi-machined chuck nut, gear guards, wrenches, and double friction countershaft.

SMALL-SIZE ENGINE LATHES.

A line of small lathes have recently been brought out by the Monarch Machine Tool Co., Sidney, Ohio. The lathes are of nine and eleven-inch swing with lengths of beds varying from two and a half to five feet. They are known to the trade as the "Monarch Junior." The lathes are provided with bench legs, or

with chip pan and floor legs. The headstock of these machines is of the solid full webbed bowl type. The spindles are hollow, having 1 1-6 inch holes through them, and are made from crucible steel accurately ground. The spindle drive is through a three step cone and single back gears. The base of the tail stock is graduated for taper turning and is so designed that it can considerably overhang the bed, giving greater distances between centres. Full quick change or semi-quick change gear boxes are provided. This permits of a wide range of thread changes for screw cutting and feeds for ordinary work. The countershaft is equipped with two Edgemount friction clutches, cast iron hangers and ring oiled bearings.

A compound rest gibbed throughout is provided. The tool post is equipped with a "Mac-It" non-breakable screw. Lead screws are thoroughly tested for accuracy. The carriage is drilled and tapped for taper attachment, chasing dial, and chasing stop. Regular equipment furnished is double friction countershaft, face plate, dog plate, center rest, follow rest, centers, compound rest and wrenches. Other accessories can be furnished and applied without any machine work or fitting.

HEAVY-DUTY GRINDING MACHINE

The Van Dorn Electric Tool Co. of Cleveland, Ohio, have recently placed on the market a heavy duty, electric driven, ball bearing, grinding machine. It is equipped with two grinding wheels 14 inches in diameter and two and one-half inches face. These wheels are mounted directly on the ends of the one and one-quarter inch motor shaft. Provision is made on the wheel guards for connection with exhaust directs when required, and a lug on each guard permits an eye-shield to be attached. The tool rests are capable of both vertical and horizontal adjustment over a wide range. An aluminum water pot is conveniently located so that a short arm movement only, is required. The pot is removable.

The motor was designed specially for this machine and is rated at 4 h.p. for normal continuous operation, and can take care of a momentary overload of three horse power. Standard motor is three phase, 60 cycle—220 or 440 volts. Special windings are also provided. The standard motor has a speed of 1200 r.p.m. The motor is completely enclosed in a dust proof housing which is smaller in diameter than the grinding wheels, which gives ample space for the operator's hands and clearance for grinding long pieces.

A fan within the motor furnishes normal ventilation, but under extreme conditions of excessive dust a supply of fresh air may be piped to the intake of the housing. The arbor or shaft is set in large ball bearings amply supported by the housing. Lubrication is accomplished by means of a grease gun inserted in grease ports. The pedestal serves as a cabinet for the switch, fuses, and connections. The cable conduit enters at the rear and no electrical apparatus is anywhere exposed. Stopping and starting is through the medium of a pedal switch located at the base of the pedestal. The spindle centre is 39 inches above the floor and the grinding wheels are 25 inches apart.

CAR WHEEL BORING MACHINE

The Betts Machine Co., 400 Blossom Road, Rochester, N.Y., have placed on the market a new car-wheel boring machine incorporating some novel features. The bed and frame are one casting. The whole machine has been designed to withstand high stresses. Simplicity of operation is also a predominating factor. The machine is driven by a single pulley or it can be direct connected to a constant-speed or variable-speed motor. There are four face plate speeds to one constant pulley speed. At the recommended pulley speed the face plate speeds are 10.2, 13.9, 20.4 and 30.7 revolutions per minute. These speeds are obtained by means of hardened steel sliding gears running in oil. The two levers used are interlocked so that no two sets of gears can be placed in mesh at the same time. The table revolves on a wide bearing. The large spindle runs in a bronze bushed bearing, and has a special collar on it to prevent lifting.

The table is equipped with a five jaw chuck that is both independent and universal. Five stations are provided for operating the chuck so that one will always be convenient to the operator.

The machine is provided with a friction clutch and a brake for quick starting and stopping. Six automatic boring and facing feeds are obtained by means of a two step cone pulley and sliding gears with instantaneous change. Facing operations are provided for regularly on the machine. The boring ram is counterweighted by a weight hung inside the frame. The machine is regularly equipped with a quick acting air operated crane for loading and unloading car wheels. This crane can also be driven by individual motor or by belt.

NEW DRILLING MACHINE

Baker Bros., of Toledo, Ohio, have added a new Light Heavy-Duty Boring and Drilling Machine to their well-known line. The new machine is known as their No. 121, and is intended for driving drills from ⅜" to 1½" in diam., as well as for boring and facing. The machine is finished either as a single purpose or a quick change drilling machine. The single purpose drilling machine can be made into a quick change machine by simply adding the gear box and some minor parts, the head being completely bored and drilled for them. It is operated through broad face, tight and loose pulleys mounted at the back of the machine on a shaft running in roller bearings. This feature of the design allows wide-faced pulleys to be used and still, if required, the machines can be operated in gangs with spindle distances, centre to centre, of 18½ in. Control levers are very conveniently located. All gears in the speed train are hardened. A wide range of feeds and speeds to suit special jobs can be obtained. The power of the machine is shown when it has been stated that a 4" pipe tap has been successfully driven by it.

The spindle is over counterweighted and a device is provided which absorbs the inertia of the return of the spindle to its top position. This device withdraws the drill automatically from the work and together with the break which is automatically applied when the belt is shifted to the loose pulley, makes for greater production throughout. A special spring device holds the belt in pace on either the fast or loose pulleys. By the use of slip gears almost any speed up to the maximum can be obtained. The single purpose standard speeds are from 144 to 468 r.p.m and for the quick change machine 38 to 632 r.p.m. Feeds on the single purpose machine vary from 0.006 inches to 0.1 inches per revolution by using the slip gears, but the standard feeds are 0.008 to .025 inches per revolution.

The quick change machine is ordinarily provided with ten changes of feed varying between 0.008 inches and 0.094 inches.

The table is of the plain box knee type raised and lowered by a telescoping screw. Compound tables having screw adjustments can be furnished. Various attachments can be furnished, such as a tapping reverse, multiple spindle head, motor drive, oil jump, gang assembly, etc. The floor space is 22" x 36", and the weight 2.100 pounds.

ALIGNING LEVEL

A sensitive machine aligning level has recently been put on the market by the Universal Boring Machine Co., Hudson, Mass. The frame, which is 27 inches long, is of cast iron, with a "truss" construction. The vial is produced from specially ground Jena glass of the best quality. It is set in a brass japanned case, mounted, and adjusted by, two brass lacquered studs. The bubble in the vial has a guaranteed sensitiveness of 5 seconds of arc, per graduation, which means that the bubble will indicate per graduation difference of about three ten thousandths of an inch.

The frame casting is insulated from the heat of the palm of the hand by a handle of non-conducting material. Great care is taken in manufacturing. After being machined the casting is thoroughly seasoned. Subsequently the base is hand scraped and tested, after which it is again subjected to a seasoning process and a further test made. Then the vial is mounted and adjusted. The weight is about 9¾ pounds.

St. Thomas.—The Monarch knitting plant is operating at more than 90 per cent. of its 1920 capacity, and a continued improvement is expected. The spinning departments are particularly busy.

Competition Between Manufacturers

BANKERS and technical journalists should be the best advisers in times like the present. Unfortunately only a limited number of them here are real authorities. The Canadian and British branch banking system tends to make machines out of bank managers. The study of big problems is done at the head offices. But, too often, when a man arrives at the head office as a result of successful promotions he is more of a detail man—more of a clerk than an executive, more accustomed to study the bank's present internal problems, than the future of the big questions—national and international money and business.

Technical journalism in Canada is still in its infancy but it is making very satisfactory progress and there are some able men engaged in our specialized newspapers and as revenue permits these papers will become stronger leaders. When you do find a real authority his advice should be carefully considered. One such man is the head of the National Bank of Commerce, New York. Here is what he said last week:—

"In the period immediately ahead, manufacturers will face the most severe competition in a generation. It is now clear that many important industries are seriously overbuilt, when measured in terms of effective demand here and abroad. There is no method by which competition can be avoided, but there are methods by which it can be successfully met. Overhead charges should be rigidly examined and cut to the lowest point consistent with production efficiency. Costs should be critically studied and such examination should include not only factory operations, but the entire producing organizations. In periods of high profits, useless frills are certain to be introduced into the best systems. Simplicity is now of necessity the watchword and much careful but courageous elimination is necessary.

"In many lines, labor costs must be further reduced. Such reduction can in part be attained by lower wages, and in part by increased efficiency in organization for production. A considerable part of labor inefficiency is at times due to actual defects in plant and organization. Business has two duties, first, to provide the best means for efficient production by its labor, and second, to insist on a day's work for a day's pay."

A Study In Patience

"THERE is no reason why a blind man with a normal brain cannot work and enjoy himself as well as the man who can see." These words were uttered recently by a blind man in Grand Rapids, Mich., who daily performs his tasks in the machine shop. This gentleman, whose name is Gerald Ensing, operates lathes, drill presses, grinders, shapers and planers with good success and according to the shop foreman of the plant in which he works, performs his tasks very efficiently.

In the Sept. 30th, 1920, issue of Canadian Machinery, we published a story showing how blind workers in Cleveland, Ohio, shops had proved efficient in machine shop work and how over sixty operations were being performed with great success. Some of these operations were completed on a piece work basis, and the blind employees could, in many cases, make just as much as men in possession of their sight. A peculiar point which has been proven in connection with blind workers, is that they are very careful, few accidents occurring.

Have you ever tried to shut your eyes, then start to perform some task in that condition? If so, you no doubt know what a poor attempt you made of it the first time. However, if you are of a patient nature, you tried again and again, until at last you found you could actually accomplish the task. True, you were slow about it, yet you felt within yourself, that if you practised long enough, you could attain speed. This is exactly what these blind workers have had to do. It has no doubt been slow and tedious work, but in the end the joy of accomplishment is quite a fine thing to feel. Truly it is a study in patience.

We were once privileged to watch a blind operator assembling small discs for a vacuum cleaner. The speed and precision with which he performed his work was amazing, and all the time he worked he smiled. Perhaps it was a smile of tolerance, to think we were so amazed at something which had taken years of patience to attain. Let us help the blind wherever we can. Help them become independent as far as earning power is concerned, and wherever possible, let employers find an operation for some sightless one in his particular locality.

MARKET DEVELOPMENTS

Railroads Have Extended the Buying Arena

American Railways Are Into Market to Limited Extent—Five Thousand Cars Have Been Ordered—Others are Being Enquired For—Local Market Brighter—Montreal Shows No Change

CONDITIONS have improved considerably during the past week. Pittsburgh reports resumption in a limited way of railroad buying. Orders for more than 5,000 freight cars have been closed during the week, and enquiries are out for more than 10,000 additional cars. Prices have been an important factor in this resumption of business.

Production of steel has tapered off a trifle from the 44 per cent. rate shown for October. Tubular goods show a slight increase, and a week ago one concern blew in a third furnace. Steel prices exhibit a sagging tendency, but this is natural, for producers are anxious to secure orders in order to maintain operations. However, it is not expected that prices will sag to any great extent.

Judge Gary and Chas. M. Schwab have placed themselves on record as strongly favoring discontinuance of the manufacture of armament. They claim that the naval program of the U. S. would have involved only a fraction of one per cent. of the steel making capacity. They believe that economic conditions will improve if it is decided to discontinue the making of armament.

Montreal reports no marked improvement over last week. No change in prices on steel lines has taken place, and the machine tool and scrap markets remain dull. The supply market is about the best of the lot, a satisfactory volume of business being closed.

In Toronto a better feeling exists. Things have picked up quite a bit during the week and dealers feel more confident. The steel market takes the lowest position, business being very poor in this line. Small tools are selling at a fair rate of speed, while the scrap metal market shows signs of life for the first time in months. The machine tool business has brightened up, one dealer claiming that so far, November is the best month he has had this year. Confidence in the future of the market, is the feature, so far as Toronto is concerned.

FIVE THOUSAND FREIGHT CARS ARE ORDERED—MORE ENQUIRIES ARE OUT

PITTSBURGH, Nov. 24th. — The increasing dullness of the steel market is relieved to an extent by resumption in a limited way of railroad buying, orders for more than 5,000 freight cars being reported in the last week, as well as inquiries for more than 10,000 cars in addition.

The gradually improving financial condition of the railroads is no doubt responsible in part for the appearance of this business, but this is not the whole story, for liquidation in prices asked for rolling stock is a necessary and important factor In the fore part of 1920, prices of $3,000 to $3,500 were being asked for ordinary steel freight cars, and such prices were altogether prohibitive. Railroads were neither able nor willing to pay any such prices, for even if the funds could be found there were no conceivable rates of freight that would enable cars to earn their keep at such cost The first steel cars cost a trifle over $1,000, and gradually the price went down until in 1914 cars were bought for less than $800. The ineradicable increases in costs would prevent such a price from being duplicated now, but to pay four prices was another matter altogether. The largest factor in making the high quotations last year was the fancy prices quoted on appurtenances of various sorts, bought by the car shops, though labor costs at the shops were very high also, on account of high rates and inefficiency. High cost of steel was also a factor, though that influence was frequently exaggerated. It is not known precisely what prices are being quoted now, but the probability is that the price for a standard car is less than double the price late in 1914, when $800 was shaded.

The Santa Fe has contracted for 2,500 refrigerator cars and the Illinois Central 1,000 of the same type. The Chicago & Illinois Midland has ordered 725 gondolas, while the Rio Grande has taken 700 cars and the Tennessee & Northern 300 cars, making a total of 5225 cars. Inquiry now out includes 3,000 cars additional for the Illinois Central and 7,300 freight cars, 127 passenger cars, and 55 locomotives for the Burlington.

Mill Operations

Production of steel appears to have tapered off a trifle from the 44 per cent. rate shown for October, and this would be a natural sequence to the quieter steel market that has been observed since the middle of that month. However, there is no great decrease, for in two respects, apart from the influence that may be exerted by the car buying reported above, operations have been increasing, the increases being in tubular goods and in tin plate. In tubular goods there has been a slight continuous increase, in both standard pipe and oil country goods. A week ago the National Tube Company (Steel Corporation) blew in a third blast furnace at the Lorain plant and the company is now putting in a third at the McKeesport works.

In tin plate the development is that the leading independents are securing specifications from large customers against their first quarter requirements, the intention being to make the tin plate at mill convenience in the next few weeks, shipments not being started until after January 1 so that the tin plate will not appear on the buyer's inventory. With this business added to current business the tin plate mills are likely to average an operation above 75 per cent. in December.

Steel prices naturally exhibit a sagging tendency when producers are anxious for orders to maintain operations and there is not enough tonnage to go

around, but now and then a halt is called at one point or another. Thus a few weeks ago a leading wire interest intimated it might advance prices in the near future, and this seems to have arrested the declining tendency that was beginning to be manifested. In sheets there is a stiffening at the present moment. At the beginning of last week shading of 3.00c for black and 4.00c for galvanized, the prices resulting from the $5 a ton advance in September, had gone so far that now and then a mill was quoting the old prices of 2.75c and 3.75c, but beginning last Saturday mills have been calling in all quotations under 3.00c and 4.00c and it looks as if the market is stabilized for the time being at those figures, which are the prices the leading interest has maintained right along since September 22nd.

In bars, shapes and plates 1.50c has been done more frequently in the past week than formerly, but this is not yet a regular quotation applicable to medium or small size lots, unless perhaps in the case of plates. It may be merely a coincidence, but the fact is that steel prices have shown more sagging tendency since the Steel Corporation's earnings report for the third quarter came out late in October. It had been believed in many circles that steel prices were in general below cost, but the corporation was found to have had profits of about $15 a ton, even with its limited rate of operating while in 1912 and 1913, when the independents made money as well as the corporation the latter's ran at about $10 a ton. The natural assumption was that after the mills had liquidated inventories and made other adjustments it would be possible to have profits at existing prices, and rather large profits if operations should increase.

Disarmament

At last Friday's meeting of the American Iron and Steel Institute the steel industry through Judge Gary and C. M. Schwab as spokesmen, went on record as strongly favoring discontinuance of the manufacture of armament, predicting that success in the conference at Washington would greatly improve the economic situation. No details were given as to the amount of steel involved, but it is a fact that the naval program of the United States has involved, and would have involved, only a fraction of one per cent. of the steel making capacity. The amount of steel used in naval construction has been exaggerated in many quarters, such exaggeration being apparently a natural tendency. Now and then it is said that the railroads consume 40 to 50 per cent. of the steel. The automobile industry is frequently credited with consuming a large percentage, and if the public estimates of the percentages of steel that go into railroads, skyscrapers, automobiles, war vessels, etc., etc., were added together one would get several hundred per cent.

The pig iron markets have been soft for several weeks with extremely light demand, and nowadays the appearance of any competitive business of importance sends the general price down a trifle. Southern iron has dropped from $19 to $18, Birmingham. Valley foundry, on a sale of a few hundred tons, is off 50 cents to $20.50, valley. Bessemer remains at $20, valley, and basic is still quoted by furnaces at $19, but there is resale iron in the hands of middlemen that could be bought at less.

Connellsville coke has weakened farther, due to operators blowing in too many ovens a few weeks ago as they over-rated the increase in demand. In the past three weeks ovens have been going out, but a good bit of coke is left on track and prices have weakened so that one could readily buy furnace coke at $3.00 to $3.15 depending on grade. Foundry coke is off 25 cents, as ordinary brands can be had at $4.00 and some very good brands at $4.50.

POINTS IN WEEK'S MARKETING NOTES

American railways have come into the market, orders for more than five thousand freight cars having been placed during the past week. In addition to this enquiries are out for over 10,000 additional cars. It is claimed that the price offered was an important factor in the closing of this business.

Steel production has tapered off since October, but the decrease is not much. Operations in tubular goods and tin plate have increased. Steel prices have exhibited a sagging tendency, but this is natural as the mills are anxious to secure orders, and there is not enough tonnage to go around. The sagging tendency is not expected to go far.

Judge Gary and Chas. M. Schwab have placed themselves on record as favoring discontinuance of the manufacture of armament. They believe that such a move would improve the economic situation. They claim that even if the U.S. naval program went through it would only involve a fraction of one per cent. of the steel making industry.

The market in Montreal is poor. No improvement over last week is shown, and apart from the supply section, there is not much stirring.

Toronto markets are better this week. For the first time in months the scrap metal market shows signs of life. It isn't much, but what little exists, is welcome.

Machine tools are more active, one dealer claiming that the first two weeks of November are the best he has had this year. The steel market is the quietest of all, so far as local activities are concerned.

THINGS LOOK BETTER THIS WEEK

TORONTO, November 24th:—There is a better feeling on the market this week, although business as a whole is not quite so good as it was last month. Take for example the steel market. Last month, dealers were quite pleased at the demand for steels and constructional material. The good weather was in their favor, builders were rushing work along, the result being satisfaction all around. But things have changed. The market is featureless. Orders are few and far between, and the size of the ones that do come in are nothing to boast about. One dealer says that he very much doubts if things will pick up to any great extent until after the new year. There has been no change in prices, nor is there likely to be any until the close of the present year. What will happen at that time no one cares to prophesy. One thing however, that dealers are agreed on is, that this week's business has been the worst for some time.

Small Tools

In the small tool market we find dissatisfaction because business has fallen off somewhat during November. Some dealers say that they cannot complain, while others again are fed up with the way their prospects are buying. One dealer who was rather peeved, remarked that if manufacturers would spend as much on tools, as they do on Christmas presents, he would be more than satisfied. Buying is practically all of the hand to mouth variety. Nothing seems to be purchased until actually needed, and then only enough to tide them over. Up to this month the small tool market has been the steadiest of all, but November seems to have been a Jonah. No decide improvement is looked for immediately, and some say that things will sort of drift along until the start of the new year.

Machine Tools

So far the story has been rather blue in tone, but good news comes from an unexpected quarter, viz, the machine tool market. Although some dealers say that conditions are still as poor as ever, the majority feel that there is no cause for grumbling. One dealer has had more orders this month already than the number received during the last two months. Lest there be those who run away with the idea that this dealer has a corner on the market let us explain that although he can report such good improvement, the number of orders closed is by no means sensational. The fact remains however that his business has picked up splendidly during the last two weeks, and he has good reason to believe that conditions are improving at last. This dealer has followed up his prospects carefully, with the result that each customer is sold on the idea and buys as soon as he can see his way clear. "We have other prospects that look good, mighty good," said this par-

ticular dealer, so that the machine tool market, so far as he is concerned, is coming out of the trough.

Other dealers in varied lines report somewhat better business, although in no case is it anything like normal. "We have faith in the market," remarked another dealer, and to prove his statement, told us of several new machines he was bringing from the factory to put into stock.

It looks as if Toronto will have a new Machinery Hall at the exhibition grounds next year. For some time past, the committee appointed to look into this matter has been working hard to line up a definite proposition to submit to the directors of the exhibition. A meeting of the manufacturers interested was held last week and the enthusiasm displayed speaks well for the future. According to Mr. Hollinrake, who is chairman of the committee, enough space has been pledged to make the building almost a certainty. "We will have more to tell you later," he said, "as soon as we have talked the matter over with the fair directors." No location has been decided upon, for the grounds are to be resurveyed and laid out differently to allow for the new radials which will later be in operation. One thing sure, a better location will be chosen than the site on which the present machinery hall stands.

The Scrap Market

A little movement has been noticed lately in red and yellow scrap metals. Some small sales have been made to consumers whose stocks have become depleted. The volume of business closed however is nothing to get in a fever about, although the promising aspect is that the movement for light buying is general throughout Canada. It is firmly believed that the time is not far distant when consumers will have to come into the market in order to buy sufficient material to keep them going. It is not expected that this demand will increase prices, for the amount required will only be limited. Such a condition arising however would be very welcome, as a stimulation of business is the first consideration. The scrap iron market is also looking for slightly better times in the near future, and as soon as foundries get a little busier, this hoped for condition will become a fact. Apart from this slightly upward trend there is no change of importance.

GENERAL BUSINESS CONDITIONS SHOW NO MARKED IMPROVEMENT

MONTREAL, Nov. 24th.—General business conditions do not show any marked improvement over that of last week. In a few instances, there are rumors that certain lines are moving rather more freely but this is not a general condition. It would appear that the business moving from week to week during the last 6 or 8 weeks, is representative of the activity of the country. There appears to be many distracting influences at present. Elections are receiving a great deal of blame in connection with the slump in general business activity. The activity co-incident with the close of navigation has about spent itself, as in the course of a few days the regular sailings from this port will be discontinued for the season. Yet with all these real and apparent difficulties the volume of business done locally by the iron and steel industries has not appreciably diminished. Withal, it would appear to be in a very healthy condition. One concern reports that the last week's business was the best they have had in 1921. This was due, not to an increase in business in any general way, but to the fact that several large orders which they had been working on for some time were closed during the week. No doubt, a similar condition of affairs takes place with some firm every week. This we can assign as the reason for market letters that tend to conflict, and with business conditions as reported from various sections of the country. During the week there has been no events of outstanding importance, such as we were able to report last week.

Steel Market

There has been no change in the prices quoted on steel lines. There was a slight drop in base prices in Montreal last week, but new prices have not resulted in any marked increase in business. Structural shapes are very quiet, and bars, are also weak. The business in sheets and plates still maintains a steady volume that has been slightly influenced on one or two occasions by reason of seasonable or local conditions, but appears to drop back to the old normal level. The rolling mills are very aggressively looking up business. The next few months appear to have little or nothing to offer, and at present the mills hope to be able to close sufficient business to enable them to operate one shift until the spring requirements commence to improve the situation, which is expected about February 15th. The recent C. P. R. and C. N. R. orders for rails are keeping the mills fairly busy but after these are filled there are no more on the books.

Machine Tools and Shop Supplies

The machine tool situation has not changed a great deal in the last few months. The idle equipment in the large shops is all that is required to answer the question of why manufacturers are out of the market. The sales reported from time to time show that a large percentage of sales are sales of rebuilt and remanufactured tools. The small shop, today, with the light overhead is reasonably busy, as these shops have gone out and cornered a great deal of the small contract work, as well as taking everything in the way of general jobbing and repairs that their equipment would permit them to handle. A rather large number of these small shops have come into the market and have purchased a miscellaneous lot of machine tools of the smaller variety. This channel has been about the only outlet for new machine tools that has presented itself to local dealers in the last few months. The prices of machine tools have all along been regarded as too high. A number of large manufacturers have from time to time reduced their prices, and some are claiming that they are selling at cost. These concessions do not appear to have produced anything in a big way in the line of business. There is no doubt that the machine tool purchaser today is getting a great deal more for his money than he has been for some time past. The supply business is in a very healthy state. Ever since liquidation has been completed this department of the trade, along with small tools, has been enjoying a very satisfactory volume of business. Prices have been from time to time reduced and now are on a very fair basis. Manufacturers have been producing an ever increasing quantity and thus have been able to reduce prices as their overhead is spread over a larger production. No special item of interest has occurred during the past week, but it can be truthfully stated that the small tool and supply business is well established on its post-war footing, and the present situation has every indication as being representative of a permanent recovery.

Pig Iron

The quiescent state of the pig iron market still continues. The volume from week to week does not change a great deal, and prices have not been altered. The foundries are not showing any inclination of coming into the market for anything more than their actual requirements. The producers show no inclination to reduce the price to a point lower than that prevailing as it would not be a profitable move for them. Thus the matter rests and from week to week the same small volume of business is moving.

Non-Ferrous Metals

No special activity is noted in the non-ferrous metals this week. The New York market is a little stronger and the London market is unchanged as far as copper is concerned. The other metals have not changed in price and in addition very little business is moving. In the local market the large consumers are not operating at anything like full capacity, and owing to certain customs regulations are able to purchase direct from the States to an advantage. This leaves the local market rather colorless. It is expected that as soon as the brass foundries resume operation on any scale that business in this line will improve. At present nothing in the immediate future suggests that the present conditions will alter very rapidly.

INDUSTRIAL NEWS

The Beaver Truck Corporation, Hamilton, Ont. are planning extensive developments.

Metal Products Ltd., Ottawa, Ont., has been incorporated with a capital of $300,000.

The Dominion Thresher and Implement Co., New Hamburg, Ont., has been incorporated with a capital of $1,000,000.

Canada's total exports for the six months period ending September 30th 1921 amounted to $335,677,131.

The McFarlane Mfg., Co., Toronto, has been incorporated with a capital of $100,000 to manufacture Woodenware.

The National Fibre Co., Neepawa, Ont. has been incorporated with a capital of $100,000 to manufacture Hemp, Flax, Sisel, Romie, Jute, etc.

The Ontario Foundation and Engineering Co., Toronto, has been incorporated with a capital of $50,000 to carry on the business of structural and mechanical engineers.

The British Columbian Electric Railway Co. have ordered ten new one-man safety cars for use on its lines in Victoria, B. C. The order was placed with the J. G. Brill Company, Preston, Ont.

Excavation for the new $150,000 addition to the Hospital in Windsor, Ont., was begun November 14th. This new addition will increase the facilities and allow more space for patients.

Construction figures in the Dominion for the month of October 1921 showed an increase over the same period 1920. The total of the 1921 figures is $18,997,200 as compared with $18,169,500 in 1920.

Summerside, P. E. I.—The town of Summerside are installing some centrifugal pumps for town water service. The water supply is from artesian wells. The pumps will have a capacity of 250 gallon per minute against 250 ft. head.

Glace Bay, C. B.—The Dominion Coal Co. have purchased two 1,000 imperial gallon centrifugal pumps from the Canadian Ingersoll Rand Co. They will be driven by 150 H. P. Crocker Wheeler motors.

Sydney, C. B.—The Sydney Foundry & Machine Works, Ltd. has received a crown grant of all the water areas fronting their properties on Sydney harbour. They will proceed at once with the construction of wharves and slips on their harbour properties.

Moncton, N. B.—The Moncton Tramway have recently purchased two Cooper gas engines of 154 h. p. each. The engines are to drive two 150 K. V. A. generators in operation to take care of the winter load.

The Bathurst Lumber Co., are building two kilns of large capacity. The construction is being done by their own engineers. The MacKinnon Steel Co., of Sherbrooke, Quebec, have received the contract for supplying the structural steel for this development.

The wage agreement known as the Montreal agreement has been renewed or extended for one month from Nov. 30 and will terminate on Dec. 31. This arrangement is to enable the United Mine Workers and the Coal Operators to further discuss the proposed wage cut of 20 per cent.

The Hydro-Electric Power Commission of Ontario has awarded a contract to the English Electric Company of Canada for traction equipment for the new Hydro Radial Cars at Windsor and Guelph. It is understood that the entire order will be manufactured in Canada at the St. Catharines plant.

The Britannia Mining and Smelting Co., Britannia, B. C., has placed a contract for machinery in their new mill which will cost $120,000. The plant, it is understood, will have a capacity of 2,500 tons of ore daily, and will cost about $1,000,000.

St. John, N. B. — The Jones Electric Supply Company have recently equipped a new department for rewinding motors and dynamos. The department is under Mr. Thos. Dowie who has had wide experience in electrical repairs in Scotland and Canada.

The Canadian Lever Spring Ltd., has been granted a Dominion charter and will manufacture in Peterboro Ont. The products of the company are springs for automobile trucks and other vehicles. They hold patent rights for Canada for a lever spring now manufactured in the United States.

James K. McNutt, secretary treasurer of the George W. Reed Co., Montreal, states that the company has done to date in 1921, approximately 65 to 70 per cent. of last year's business, which makes 1921 equal to any year in the history of the company with the exception of last year.

According to records at Prince Albert, Sask., over 5,000 cars of wheat have already been shipped out of Northern Sack. This is estimated to be 50 per cent. to 60 per cent. of the whole crop. The average yield will run between 30 and 35 bushels per acre of wheat in the Prince Albert district.

Kitchener, Ont.—The plans of Architect Franklin, of Toronto, for remodeling and enlarging Sudaby School at an estimated cost of $135,000 have been accepted. The work is to be begun in the new year. The new building will contain 21 classrooms and assembly hall, as compared with 12 in the present building.

The Michigan Central Railway reinstated 30 mechanics in the engine department at St. Thomas this past week. The Marquette Railway also reinstated about the same number of men this week, and officials report that more men will be taken on in the course of the next ten days. A general improvement in traffic departments is reported from many cities.

Gordon G. Thompson, of the firm of Morton & Thompson, Halifax, died a few days ago after an illness of four days. He was only 40 years of age, and it is thought that the operation for appendicitis which was performed a few days ago was too much for him, as previous to that he had only recovered from pleurisy. Mr. Thompson was well known in Halifax, and was engaged in many kinds of welfare work.

Bathurst, N. B.—The city pumping station, formerly steam operated, is being replaced by the latest type of centrifugal pumps. The new installation will consist of two Cameron pumps of a capacity of 600 gallons per minute each. They will be driven by 60 H. P. Weeks motors and the pumps will be so arranged that they can be operated in parallel, or series. Power will be supplied by Nepisequite River Power Co.

A new factory will be started in North Bay next spring according to A. T. Stone, of Detroit. About 100 men will be employed, and about 28 different products of rock will be turned out, these rocks being all found in Northern Ontario. The other industrial prospects for North Bay are the British Chair, Seat & Panel Engraving Co., which uses hard wood, and is thinking of leaving the Old Country and establishing here, owing to the high price of hardwood in England and a firm which uses waste wood pulp to make fibre for wooden containers.

The Board of Education, Dundas, Ont., contemplate the erection of a high school at the cost of $100,000.

Additional contracts have been granted for the addition to the W. C. T. U. building, Toronto, costing $125,000.

Contracts for marble and tile for an apartment house costing $250,000 to be erected in Montreal, Quebec, has been placed with a firm in that city.

The Erie Hotel Company has secured a charter to erect two summer hotels in Port Dover at a total expenditure of at least $100,000. The hotels when completed will take up 132 feet frontage.

Mr. W. G. Fallen, manager of the Galt Arena, Limited, has awarded a contract for an 80 x 200-ft. arena to the Tory Factory Co. The cost is estimated at $80,000.

The Ontario Show Case Co. have received a permit to build a 3-storey brick warehouse at 624-626 King St. W. Toronto, Ont., to cost $25,000.

The October statements of the industrial department of the Harbor Commission shows that 15 firms are considering locating on the sites owned by the commission, while a number of outside firms have definitely decided to establish plants in Toronto.

Gross earnings of the C. N. R. for the week ending November 14 amounted to $2,572,439. Gross earnings for the year to date total $95,372,799 against $92,909,656 last year.

Nearly two million dollars have been expended in the province of Saskatchewan this year in the construction and repair of highways, bridges, draining, etc., according to a summary made by the department of highways.

The International Harvester Co., Hamilton, have resumed operations in their malleable iron foundry. Thirty-five men have been taken on, and it is expected that the grey iron foundry will open up in about a month's time.

The Kinleith Paper Co., St. Catharines, are in the market for a 24-in. lathe, with 15-ft. bed. This concern is considering the building of a new paper making machine for their own use, and in the event of this materializing, additional equipment would be required.

The total value of building permits in 56 Canadian cities during September last was $9,988,147 as compared with $9,654,095 in August and $9,174,181 in September of last year. Nova Scotia, Quebec, Ontario, Alberta, and British Columbia registered gains over the three preceding months.

F. W. Hudson, assistant to the general manager of the National Iron Corporation, Toronto, gave an address a few days ago before the Toronto branch of the Engineering Institute of Canada on the new method of casting pipes by the centrifugal process. Moving pictures were shown of both the old and new process.

A new technical school to cost $200,000 is contemplated for the eastern districts of Toronto. The old Technical school situated on College street has been sold to the city by the board of education for $232,000. The old Technical school will probably be used as a police administration building.

City Architect Price of the city of Toronto has stated that building is showing unprecedented activities for this time of the year. He goes on to say that up to Nov. 17 they will have issued permits to the value of a million and a quarter this month. He further states that in November, 1920, the amount of permits total $1,800,000.

Excellent progress is being made on Ottawa's new $2,750,000 civic hospital on Carling avenue. The stone work has been completed to the top of the fifth storey and it is expected that this part of the construction will be entirely completed by Christmas. There are 125 men employed on the job at the present time.

The contract for the construction of the plant of the Red Arrow Tires, Limited at Peterborough, Ont., has been awarded to John E. Hayes & Son of that city. The contract calls for the completion of the plant within 120 days. The first unit, when in operation, will employ between 400 and 500 men according to a statement made by the company.

A new company is being formed in Toronto to manufacture Contraflo boilers. The new type of boiler is composed of separate sections, the number depending upon the heat required. The chief advantages claimed are: The use of slag, or soft coal as fuel, small upkeep, and portability. No brick walls are demolished to get such boilers into place, but one man can carry the parts to desired location and erect in sections. Fuller description, with story of installation will be given at a later date, probably in the next issue.

The Mayor of Sydney, Nova Scotia, who has been in Ottawa this past week interviewing the government officials with the object of securing business for the Dominion Steel Co., thereby relieving unemployment, telegraphed to the citizens committee that he had a satisfactory interview with the Hon. J. A. Stewart, Sir Joseph Flavelle, chairman of the Grand Trunk Railway, and D. B. Hanna, president of the Canadian National Railways, the result being a definite promise of an early further order for 20,000 tons of rails with a strong possibility of a further 15,000 tons.

The eighth annual meeting of the Ontario Associated Boards of Trade and Chambers of Commerce was opened in Brantford on November 17th. President John Elliott in his chairman's remarks sounded the note of optimism by saying that present indications in trade and commerce justified the assemblage. He believed that Canada has passed the crisis of her affairs and that all the present business activities pointed to a renewal of industry and a return to normal conditions. He said we had learned that in the fiscal year 1918-1919 the total trade was over $70,000,000. Exports being $36,700,000, and imports $33,300,000. It is surprising to note that of the total turnover of $70,000,000 Great Britain's share was only $5,000,000, Canada's share $15,000,000, where the United States had $23,000,000.

The recent shipping, engineering and machinery exhibition which was opened at Olympia, London, on Sept. 27th, has proved a decided success, according to information received from overseas. Good crowds attended, and a larger amount of actual business was closed than was believed possible in the present depressed state of the market.

The Nova Scotia Power Commission have completed the part of Hydro development known as the St. Margetto Bay development, and will test the system shortly. The substation at Halifax for receiving power from the Hydro system is complete, and all that remains to be done is the settlement of the dispute about distribution in the city which has been on for the past 6 months. In 10 days time the power commission will be in a position to deliver power at the rate of 20,000,000 k.w.h. per year and with the future development which is now well in hand the total capacity will be 30,000,000 h.p.

SAFETY CAMPAIGN PROVES SUCCESSFUL

The safety campaign which was launched over a year ago by the Algoma Steel Co., has shown remarkable results. For the year previous to the campaign, the general plant accident record stood at 1.64 per 100 full time workers, while for the first year of the campaign, the rate figure dropped to .60 per 100 full time.

The economic saving for the year to the men themselves is remarkable. Conservatively estimating wages at $6 per day, in 1920 the men lost $62,396. For the first year of the campaign, the loss in dollars has been found on the same basis to have been reduced to $15,312, less than one quarter of the former total. Director McGue reports that certain of the operating departments have been making records for themselves. For instance, the coke ovens, recognized in any steel plant as one of the most dangerous departments, from the viewpoint of acicdent, ran for seven months without a single lost time reportable accident, three months and 18 days of this period being continuous. This makes the Algoma coke ovens considerably lower in accident rate than the average figure of all the other coke ovens in America.

The accident rate in the Algoma ovens is 55.3 per 1000 men working 300 days or 0.55 per cent. per month. The lowest rate for all coke ovens in the United States is 86 per 1000 working-

men, working 300 days or 0.86 per month. The fine showing is due to the effective personal work of Supt. William Seymour, Asst. Supt. A. E. Davies and their foremen. The merchant Mills looked upon as the accident "bete noir" of the whole plant also made a great showing under Supt. James Lycott. The mills went five months without a single reportable loss time accident, three of these months being in succession. The records just made up for the first year have proved very convincing to the Algoma Steel executive and to the 3000 employees of the plant. The moral loss from accidents, the suffering endured both by the individual man and his family, the impairment of the individual's working ability and his efficiency, and the maiming of men have been reduced almost to the minimum by the safety campaign, the result of which in one year has been of incalculable good to everybody

EXPECT TO EXPORT HEAVY TOOLS SHORTLY

The machine tool market in Great Britain is burdened at present by an excess of machine tools used for war purposes. According to F. W. Field, H. M. trade commissioner at Toronto, this condition has largely prevented the trade from making a satisfactory recovery from war conditions. He says that the period of reconstruction of other industries now being largely over machine tool manufacturers are looking round for fresh fields. It is perhaps not too much to say, he continues, that almost every industry leads back to the machine tool as the beginning of its operations, and consequently any revival in trade must affect the machine tool industry. Modern agriculture, for instance, is conducted largely on the lines of mechanical operation by means of tractors and motor ploughs, etc., in the production of which machine tools play so important a part; and similarly with other industries.

A reduction in the cost per ton of machine tools exported is now assured as a result of recent negotiations between manufacturers and employees, by which wages are to be adjusted to the [illegible] cost of living, and also on account of the great reduction that has recently taken place in the cost of material. It is stated by those intimately in touch with the industry that British manufacturers will be able in the next few months to maintain their exports of heavy machine tools, with an addition of lighter machines. Exports of machinery are at present stemming the fall in general exports and the outstanding items in this connection are machine tools, boilers, electrical machines and textile machinery .

SHIPBUILDING TAKES DROP

The report of Lloyd's register on shipbuilding returns in England for the quarter ended September 30 shows that the depression in the industry has become still more acute. The merchant tonnage nominally returned as under construction in the United Kingdom at the end of September, 1921, amounted to 3,282,972 tons, which in itself represents a reduction of about 250,000 tons from the June quarter. The figures, however, as on that occasion, include a considerable amount of tonnage on which work has been suspended owing to the decline in demand, and a further quantity, the completion of which has been postponed owing to various causes. As the former amounts to 731,000 tons and the latter to 457,000 tons, an amount totalling no less than 1,188,000 tons, or 36 per cent. of the whole quantity, must be deducted in order to reach the real result, namely, the reduced total of 2,095,000 tons, a heavy falling off from the 3,731,098 tons which was being actually constructed on September 30, 1920.

Similarly there has been a considerable reduction in the tonnage launched, and although this was only 14,000 tons less than the June quarter, the great falling off is apparent when it is stated that the vesels launched during the same quarter a year ago aggregated 478,361 tons.

The tonnage commenced during the quarter under review only amounted to 51,343 tons, and similarly, while the diminution from June is comparatively slight, the figures a year ago totalled 519,065 tons.

The depression in shipbuilding is, however, to a certain extent universal. The total merchant tonnage building abroad has fallen to 2,260,006 tons, which includes 375,000 tons of suspended work, mainly in the United States and Italy.

New Catalogues

The Adriance Machine Works, Inc., Brooklyn, N. Y., have sent us some interesting catalogues on their line of presses. This includes the straight side, and inclinable power presses, etc.

The Shore Instrument & Mfg. Co. have forwarded us two bulletins, one on their scleoscope model C1, also on their pyroscope. Both bulletins are well illustrated and contain considerable data regarding both products mentioned.

The H. A. Drury Co., Montreal, have issued a very useful book entitled "Hints on Steel." This has just been completed by their principals, Messrs. Sanderson Bros. & Newbould, Ltd., Sheffield, England. It starts off with a brief history of the company, shows the styles and grades of steels produced, then goes on to give several valuable hints in the treatment of steels. Hints are also given to drill users and various tables are embodied in the book. The pages are well illustrated and number over a hundred.

The V. & O. Press Co. Brooklyn N.Y., have sent us a catalogue of loose leaf form, which really comprises many bulletins on their varied line of presses. Over 100 pages is taken up with description and specifications of these lines, the variety ranging from the small bench press to the heavy floor types.

The Precision and Thread .Grinder Mfg. Co., Philadelphia, have issued a seven-page circular on their thread lead variator. This booklet gives full description for setting and operating the variator and gauge blocks. A diagram questionnaire also explains how the variator may be used on different lathes by merely supplying extra units and ways adaptors.

"It's a Thor" is the title of a new 16-page, 3 1-2 by 6 1-4 inch pocket size booklet which is being issued by the Independent Pneumatic Tool Co., Chicago. This booklet will show the complete line of portable electric drills and grinderrs, handled by above company, giving uses for same, specifications and prices. Among the new tools shown will be some slow speed electric drills for driving screws, portable electric drill stand, portable electric grinder stand, and portable electric grinder having an 8-inch emery wheel. This new booklet will be ready for distribution Dec. 1st.

The Dodge Mfg. Co., Toronto, Ont., have sent us a complete and carefully prepared catalogue B10, which describes in detail their varied lines. They start off with shafting, then proceed to show all lines of transmission machinery and supplies. This includes safety collars, couplings of all kinds, clutches, all types of bearings and hangers, wall brackets, wood split and iron pulleys, tight and loose pulleys, friction clutches of patented design, transmission tension carriages, cotton driving ropes, pull back sheaves, hoisting cables, mule stands, all sorts of belting, belt clamps, take-ups, elevator boots, detachable chains, riveted chains, elevator buckets, spiral conveyors, etc., etc. Various handy tables are included, and over 30 pages are taken up describing the many and varied lines.

JAPANESE RAILWAY ELECTRIFICATION

A comprehensive plan has been adopted for the electrification of the Japanese Government railroads and a special bureau has been established to carry out the work. The first sections to be electrified will be the Tokaido line, 408 miles, from Tokyo to Kobe, and a portion of the central line between Tokyo and Kofu. It is propsed to supply power from a hydroelectric plant on the Shinano River. Electrification of the seven-mile section now in operation over Usui Pass, between Tokyo and Nagano, has been highly successful, according to Commerce Monthly. The substitution of electric for steam locomotives has done away with the smoke nuisance in the 26 tunnels which make up more than 40 per cent. of the line and has permitted also the hauling of heavier tonnage on the steep grades.

Large Variety of Products Were Displayed

Woodworking Tools—Metal Working Machines—Pumps—Screw Products—Brass and Other Metal Castings—Milking Machines—Ventilating Apparatus—Knives, etc.

A MADE-IN-GALT exposition which was a revelation to citizens and visitors alike, as to the industrial development and potentialities of that city, was held in the curling and skating rinks there, Nov. 12 to 19.

When it was decided, at a meeting of manufacturers, just two weeks before, that Galt should participate in its first exposition, there was some occasion for doubt that the required amount of work could be done in that time. But the organization was completed with Col. A. J. Oliver of The R. McDougall Co., as chairman; Beverley Neill, of The Canada Machinery Corporation, as secretary, and Chas. Webster as manager, backed by committees, and it was not long before an enthusiasm developed that guaranteed results. The rinks were divided into 140 units, each 7 feet square, flags, bunting and evergreens transformed the scene and lighting and heating arrangements perfected.

When Mayor Charlton opened the show, Nov. 12, there were 70 exhibits in position, the majority of which had taken two or more units. One of the surprises was the fact that there were several displays representing industries of which some of the oldest inhabitants had known nothing. It was an exposition which, for diversity of industries, evident standard of quality, and general tone of long-established merit apparent in well known trade marks and names, one could easily imagine difficult of duplication. Galt has a population of 16,000, and her independent and inter-dependent development of industries has given her a place in the forefront of Canadian manufacturing centres. Others cities might make grand showing of few specialized industries, but in the matter of variety of specialty, Galt is unique.

It was further evident that many industries represented were outshoots of older ones, thus giving some force to the saying that one good industry begets several others. Thus has Galt thrived, retaining for her purpose operatives, who by reason of their experience in Galt shops, have everywhere recognized reputations for efficiency.

There were displays of metal and woodworking machinery, pumps of many types, fire and burglar proof safes, taps, dies, gauge and other small tools, machine screw products, brass, bronze, aluminum grey iron and malleable castings, edge tools, hand and machine; saws in great variety, motor accessories, milking machines, washing machines, talking machines, knitted underwear and knitted fabrics and outer garments, kimona cloths, buffalo robes, silk yarns, gloves, hats, ornamental wood and metal work, furniture, closet and bathroom equipment, tacks and nails, elevator equipment, ventilating apparatus, power fans for industrial purposes, products of the confectioner and baker, boots and shoes, stoves, furnaces and electric lighting fixtures, account registers and counter check books, stokers and grates and specimens of welding, metal finishing and polishing. In connection with many of the exhibits there were interesting demonstrations.

The exposition was open from two o'clock and on into the evening and was well attended not only by citizens but also by people from the surrounding country. Among the visitors was W. K. George, former president of the Toronto National Exposition. He expressed himself as greatly impressed by the extent of the show, and stated that a special Galt building at the National Exposition was worthy of serious consideration. Something further may, in fact, develop from this idea. Certainly this is not Galt's last exposition.

Of those exhibits calculated to be of interest to readers of Canadian Machinery brief descriptions are here given:

Galt Stove & Furnace Co.—Kitchen ranges and coal and wood heaters in seventeen different types. Also two hot air furnaces of the pipeless variety.

Canadian Potato Machinery Co.—Potato planters and diggers, shade and fruit tree sprayers, pen and stall sidings and other stable equipment.

K. T. Foundry Co.—Grey iron castings, plumbers' standard and special pipe fittings, cast iron plumbing specialties, builders' and hardware castings, repetition castings for phonograph, washing machines and electric motors.

St. Clair Bros.—Concrete mixers and other contractors' machinery, vertical steam engines, drop and hand forgings

Victoria Wheel Co.—Poles, shafts, rims, spokes and other bent goods.

Dominion Tack & Nail Co.—Display of tacks and nails in 600 different varieties.

Galt Knife Co.—Edge tools and heads for woodworking machinery, door heads, matcher heads, profile heads, sash heads and shiplap heads.

Peter Hay Knife Co.—Edge tools and attachments for woodworking machinery.

Geo. C. Kaiting & Sons—Power and hand-operated washing machines; also sun glare shields for motor cars.

Langley & Austin—Products of brass, bronze and aluminum foundry, including large bronze bushings for rubber mills, weight 213 pounds; aluminum square ham boilers, ornamental electric fixtures, trolley wheels, etc A unique item was a cup, saucer and spoon in a one-piece brass casting.

Canadian Brass Co.—Bathroom and closet fixtures, seats, tanks, taps and valves representing the B. O. T. line.

Galt Brass Co.—Perfecto brass goods, oil regulated flush valves. Vitro closet tanks, and other closet and bathroom equipment.

Shurley & Dietrich—Large wall display of crosscut, circular, band, hack and hand saws, including a hand saw made in Galt in 1873 and used by an Ottawa carpenter for 40 years.

Cut Soles, Limited—Machine for cutting leather shoe soles in pairs, right and left, in high speed operation.

Stevens Company—Hand miller, universal tool and cutter grinder, drill, miller and bench vises, parts of special machines used in motor car production.

Galt Welding Co.—Luggage carriers for motor cars, factory stools and specimens of welding, with the sign "We can weld anything but a broken heart." Welding demonstrations during the exhibition.

Galt Foundry Co.—Sprinkler stokers, dumping grates and MacNaughton sectional grates.

Galt Edge Tool Co.—Carpenters' chisels, axes and knives for woodworking.

Perfect Machine Co.—Machine tools, sixteen in all, including two tool room lathes 18" x 8', and 12" x 6'; grinders, 6" x 24"; buffers up to 26"; hacksaws in three different sizes including a high speed machine and vertical drills in different sizes, the arrangement suggesting adaptability for general machine shop or modern garage equipment.

Preston & Schwartz—Taps, dies and also small tools.

Roelofson Elevator Works—Warehouse elevators, dumb waiters and elevating drums, motors, guard doors and other equipment.

The Goldie & McCulloch Co.—Rees Roturbo pumps, showing details of construction; a vertical, enclosed, forced lubrication steam engine; a 200 h.p. Wait steam turbine, 3,600 revolutions per minute with steam pressure of 175 lbs. per square inch; photo of engine No. 1, installed 62 years ago and still running in the plant of Chas. Barber & Son, Meaford; boiler heads with gauge equipment, and a display of safety vault doors; standard fireproof safe and a burglar proof safe with time lock, two combinations on the outer door and two combinations controlling the three-compartment interior. This safe was sold to a financial institution during the exhibition.

An effective feature of the Goldie & McCulloch display was the illumination of a large Rees Roturbo transparency sign by means of violet lights behind a sheet of water falling into a tank from a horizontal pipe about eight feet above the floor. The steady flow of water was supplied by a small Roturbo pump, with 3 inch intake, attached to a five horsepower motor. The pump, at 1,400 revolutions per minute, had a capacity of 200 gallons with 60 foot head, and demonstrated the adaptability of Roturbo pumps, even in the smaller sizes, for shop circulating systems, or the general range of purposes. The pump stood on a light wooden frame without vibration or oscillation, and apparently motionless though in operation

The R. McDougall Co.—Display in two sections—one of machine tools, including their 20 in. crank shaper, 16 in. engine lathe and 20 in. vertical drilling machine, and the other section, of different types of cistern and well hand pumps and power pumps for all purposes, including contractors' pumps, rotary pumps for dairy, creamery or cheese factory purposes and their new electric house service pumps in operation. This is a late addition to the McDougall line. It is of the double-acting type with a capacity of 180 gallons per hr. The installation is equipped with automatic controllers which are set for a minimum pressure of 20 lbs. and a maximum of 40 lbs., with other ranges of pressure possible. The display included an old time well and

pulley bucket, supplying an interesting contrast in comparison with the latest water pumping equipment, and considerable interest centered in a tilted glass pitcher attached to a house service pump, from which ran an unending stream of black liquid concealing a secret feed pipe.

Sheldon's Systems—Keith fans, cupola fans, disc fans, air purifiers and oil separators, ventilating, heating, exhausting and drying equipment. A model factory building with equipment in position was used in demonstrating a heating and ventilating installation in operation.

Cowan & Co.—Woodworking machinery, including pony surface planer, hollow chisel mortiser, scroll saw, chain saw mortiser power feed rip saw, and automatic knife grinder for planer knives.

Canada Machinery Corporation—Machine tool display including 26" x 30" crank shaper, the largest and heaviest machine of this kind made in Canada; 20" x 30" x 12' quick change gap lathe, weighing 5,600 lbs.; single spindle high speed ball-bearing shaper with spindle working speed of 8,000 r.p.m.; ball bearing band saw with single string transmission operation from a sixteenth h.p. motor and a self-feed rip saw of the latest type. This is a new machine having a capacity for saws as large as 20" diameter and maximum cut of 6½" and stock 18 in wide may be ripped with the standard machine but the end of the mandrel is extended to allow the use of gang saws or dado head and to give a nipping width of 24 in. The construction is such as to give an equal distribution of weight from the centre on the infeed and outfeed rolls, thus adding to the strength and rigidity of the machine.

Galt Machine Screw Co.—Machine screw products, including hexagon, slotted and castle nuts, cap and set screws, coupling bolts, planer bolts, taper pins, boiler patch bolts, special parts for motor cars, also a display of instruments and gauges used in the manufacture and inspection of machine screw products.

Greenfield Tap & Die Corporation — "Little Giant" sets taps and dies, and an elaborate display of screw plates, reamers, gauges, wrenches and screw cutting tools in different sizes and assortments.

Elliott & Whiteall—Milling cutters, reamers, dies; also display of Gill water taps, a new type of tap which does away with washers of either flat or plug variety.

Galt Malleable Iron Co.—Railroad, motor car, transmission and farm implement castings.

The Sturtevant Co. of Canada—Planing mill exhausters, multivane electric exhaust fans, auto-force ventilator, ventilating sets, gas boosters, electric vacuum cleaners, cupola forge blowers and other ventilating exhaust and blower equipment.

Board of Works, Galt—Crushed rock from city stone quarry; also samples of asphalt concrete pavement, such as has been used in extensive street improvement in Galt during the past year.

The Galt Art Metal Co—Booth finished in art metal with display of metal refrigerators, sash, ceilings, walls and garage model.

Important Light on Canadian Patent Act

JOHN Munnoch, division court clerk of the Sault Ste Marie district, who has made a study of the Canadian Patent act, and its operation for the past six years, declares that from the standpoint of bringing new industries into Canada, the importance of the Patent Act transcends even the tariff issue. He declares that there are 10,000 articles being manufactured in the United States which, under the provisions of the Patent Act and owing to the non-enforcement of that act, should be made in Canada. Not only has Mr. Munnoch impressed the Sault board of trade with the cogency of his arguments, but he has carried the matter to Premier Meighen, who is said to have expressed regret that action could not have been taken by the government prior to election. The Associated Boards of Trade at their convention in Brantford in November will discuss the matter. The Sault board having just forwarded a resolution covering the question.

An American taking out a Canadian patent has two years in which to start manufacturing operations on this side of the border. If he can show a good and sufficient reason, and makes application before an expiration of the two years, he can secure a year's extension. This provision of the act is not enforced. It works out in practice, that once an American gets his patent, he continues to manufacture the article patented in his own American factory, and it is said that there are 10,000 such articles being produced, and shipped to Canada, while there are about 20,000 American patentees all told. The Canadian patent office keeps no check, once a patent is granted, as to whether its manufacture in Canada is ever attempted. It might be fair that an American patentee failing to meet the requirements of the act, and build a factory in Canada, loses his rights automatically. In actual practice, however, if some enterprising Canadian starts the manufacture of the patented article, an injunction is secured, and the way is opened up for some expensive and long drawn out litigation. In the meantime, the Canadian producer is tied up completely, pending a settlement in the courts. It is a prospect which discourages any attempt on the part of Canadian manufacturers to infringe on so-called American patents rights, even although under the terms of the very act by which these rights were granted, the patent should be null and void in Canada.

Mr. Munnoch states, to prove his case, that anywhere one goes, American articles for which patents have been secured in Canada and which are still made in the U.S. may be found. In the new Parliament buildings, Ottawa, steam traps, meters, etc., are to be found all bearing the stamp of U.S. manufacture. A modern machine shop will show lathes, drills, stamps and tools protected by Canadian patent but made in the U.S. The typewriter, the adding machine, the stamper, the check protector, are said to be in the same class.

The importance of the question is emphasized by some figures as to patents granted in Canada. In 1919, there were 9527 patents taken out, of which 6856 were American patentees, in 1918, there were 6052 issued, and 4569 American, and in 1917, there 7233 issued, with 5631 of that number of American origin. The average in any period would be found over 70 per cent., and the question arises, are the articles for which these patents are issued manufactured in Canada as stipulated by the Patent Act? The answer according to Mr. Munnoch is that manufacture in Canada is the exception, where it should be the rule.

It has been estimated that putting the number of articles at 10,000 which should under the law be in the process of production in the Dominion, employment would be provided, very largely for skilled labor, for 300,000 operatives, It is pointed out that in normal years about 90,000 Canadians go to the United States, of whom only about 8,000 are not accounted for, and that there is a large percentage of the 90,000 who would not find opportunities better in the U.S., if the Canadian Patent Act were rigidly enforced. The weak point in the Canadian Patent Act is that it gives an American patentee the opportunity of fighting in our own courts in such a way as to defy one of our own laws, by using the injunction process. Several remedies have been brought forward, the most simple of which seems to lie in the appointment of a Controller of Patent Licenses, whose duties shall be devoted to the prompt enforcement of the Canada Patent Act in respect to surrender cancellation of patents or licenses granted under the act. An amendment to distinguish assembling of parts from actual manufacture is also desirable, according to Mr. Munnoch from the viewpoint of Canadian employment.

In support of changes and the tightening up of the Candian Patent Act, it is urged that the results achieved in other countries show actual negligence in Canada. The Patent Act should be made the strong arm of industrial development, Germany having shown the world what could be done in this regard. The Patent Act of Great Britain is one of the industrial supports of the nation, while the act framed at Washington guards American rights very jealously. The question is regarded as a non-partisan one, and is being presented as such at the Associated Boards of Trade convention. It is not too much to say, however, that Premier Meighen, and others of his party, who are now emphasizing tariff are seized with its importance, and that some radical changes in the operation of the Patent Act of Canada may be looked for. When they come, opportunity will be afforded many Canadian industries to broaden out, if not, it will mean that many American concerns will have to establish branch factories in Canada, if they wish to protect the trade which they have built up on articles which they produce and for which they have received Canadian patent protection, without returning the quid pro quo, as called for under the act. This quid pro quo is virtually an agreement to start manufacture in Canada within two years after securing a patent license.

Have You Tried This Contest Yet? If not--- Do so Now

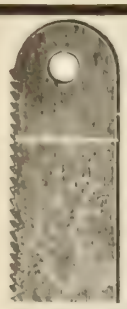
Below will be found twelve references to advertisements in this number. To the sender of the first correct set of answers to these we will forward one of these scales.
To win one is not difficult, and at the same time you will add to your store of knowledge. Read the details given below.

The scale is 6 in. long and is made from finest quality steel. One side is marked in 32nds, the other side in 64ths. A table of decimal equivalents is also stamped on one side, and a table of tap drill sizes on the reverse side. This scale is well worth securing.

What You Have to Do

We publish every week a number of interesting facts or statements selected from the advertising pages for that week. The selections for this issue are given below. Read these through, then turn to the advertising section and see if you can pick out the advertisements to which they refer. The work is interesting, it will train your powers of perception and of memory, it costs you nothing, it will make you better acquainted with the various lines of machinery and tools in the market, and with perseverance you are bound to win one of these useful scales as a prize.

Unfortunately, in spite of the many answers sent in, not one was correct. Question seven was the trouble. The "Good Advice" we referred to was "Don't let present-day conditions worry you; everything is fundamentally sound." Refer to Pg. 61 in the Nov. 3rd issue.



CONTEST FOR NOVEMBER 24th ISSUE
Contestants are required to write us, stating to which advertisements we refer in this number.

1—Something that is going begging.
2—A product that is self contained.
3—Something that combines two advantages.
4—How to get the advantage of 30 years' experience.
5—Something that is giving good satisfaction.
6—When to discard—even when not playing poker.
7—Something that is fully guaranteed.
8—A very essential quality—where?
9—A product said to be for every purpose.
10—Something distinctive.
11—How to get over your control problems.
12—Something that's full in spite of prohibition.

These are Correct Answers for List from November 3rd Issue

1—Pratt & Whitney Co.
2—Diamond State Fibre Co.
3—E. W. Bliss Co.
4—Franklin Die Casting Corp.
5—Dominion Rubber Systems.
6—Canadian Desmond Stephan Co.
7—E. C. Atkins Co.
8—Geometric Tool Co.
9—Oliver Machinery Co.
10—Cincinnati Electric Tool Co.
11—Wallace Barnes Co.
12—J. H. Williams Co.

Closing Date for This Contest is December 15th.

SIMONDS

Non-Breaking

Hard Edge
Hack Saw Blades

When you put a Simonds Hard Edge Blade in your Hack Saw Frame you are assured of the maximum of cutting service, because these are the blades that cut fast, do not shell teeth, and when properly used they are non-breaking.

They are scientifically heat-treated and smoothly finished.

FUTURE OF RAILROADING

MR. W. R. Stinemetz, manager of the heavy traction railway department, of the Westinghouse Electric Co., of East Pittsburg, Pa., presented a paper on "The Future of Railroading is Electrification" before the Railway Club in Montreal on November 8th. Mr. Stinemetz classed Electrification as, desirable, at present, but felt sure it would, in the future, become a necessary factor. The steam locomotive has been developed over a period of nearly a century and is today a highly efficient machine, but possessed of certain basic disadvantages. The tractive effort, or draw bar pull, of any locomotive is limited by the adhesive effect of the driving wheels on the rails, which factor is controlled largely by the weight of the locomotive. The power of a steam locomotive is limited by the steaming ability of its boiler. On the other hand an electric locomotive is not compelled to carry its power plant with it, but can draw upon the stationary power plant, up to one or the other, of two limiting factors, namely the amount of power that the motors of the locomotive can develop in safety without running the risk of burning out, or the total power developed by the stationary generating plant. "Electric locomotives," he said, "produce a more uniform torque on the driving axles, and also develop their maximum torque when at rest, thus enabling them to start heavy trains with ease and to make a remarkable showing on grades." Some railways in mountainous territories according to Mr. Stinemetz, have certain mountain sections over which trains can not be hauled by steam locomotives at a greater speed than five miles an hour. Now this naturally slowed up the whole trunk line, limiting its total capacity. Electric locomotives have been called upon to operate over these grade sections and have hauled these same trains at speeds from fourteen to twenty-five miles per hour. Such was the experience of the Norfolk & Western Railway. To increase the capacity of their lines they were faced with the problem of laying additional tracks, but overcame the difficulty through the use of the electric locomotive. On this line all electricity was generated by steam plants. The Norfolk & Western Railway modern mallet, compound, superheating steam locomotives, equipped with all improvements except feed water heaters, require 5.4 lbs. of coal per draw bar horse power when operating under their road conditions. With electric operation, about 3.3 lbs. of coal per drawbar horse power is required, which is a saving of 40 per cent. The additional saving in crew cost, due to the additional work the electric locomotive can perform in a given time, has been stated to be nearly 40 per cent.

Another feature of the electric locomotive is its ability to make long runs with a minimum of round house attention. The electric passenger locomotives on the electrified sections of the Chicago Milwaukee and St. Paul Railway make daily runs of 440 miles. Crews are changed once, but the locomotive continues on its way. These locomotives are taken off for shop inspection every eight or ten trips after they have made mileages from three to five thousand miles. These locomotives make between ten and eleven thousand revenue miles per month. In suburban and commuting services more intensive uses of facilities can be made. Here an electric locomotive is not always employed. Each car has its own electric motors and thus multiple unit trains are operated. These trains run into terminals, unload, load and are away again, the motorman merely walking from one end of a train to another.

Cold weather does not tend to lessen the efficiency of an electric locomotive. The necessity of firemen on locomotives is dispensed with. Where water power is available the cheaper power is an added advantage. Electrification of steam roads is almost world wide. Orders for electric locomotives are being filled in the U.S. for Europe for Sweden, France, Japan, Switzerland, Italy, Brazil and Chile. The Westinghouse Co., in Pittsburgh is now working on a $7,000,000, order for complete electrification of the 200 mile line between Valparaiso and Santiago, for the Chilean Government. Thirty-nine locomotives are ordered. Other large amounts are being spent in the various countries. Where long tunnels exist it is a positive necessity for electrification to be installed for the purposes of ventilation.

Mr. Willimas of the Engineering Department of the Chicago, Milwaukee and St. Paul outlined some of the actual experiences of his road in connection with the two electrified divisions in the mountainous sections. He showed some remarkable savings and unusual advantages derived from the use of electric locomotives.

A resident of Edmonston, N. B., discovered natural gas a few days ago. The first indication of its existance was that bubbles were noticed on the surface of the Madawaska river at a point where it passes through the heart of the city An investigation was undertaken by a Moncton engineer, Mr. Matthew Lodge who found traces of gas at many points It was decided to drive a pipe into the river bed which was done. and on lighting the gas there was a slight explosion blowing the pipe out of the workman's hands. Another pipe was driven having the end capped but the pressure of gas was so great that they again lost the pipe. A geologist was brought down from Ottawa to continue the investigation into the supply. He will report the result of observations in a few days.

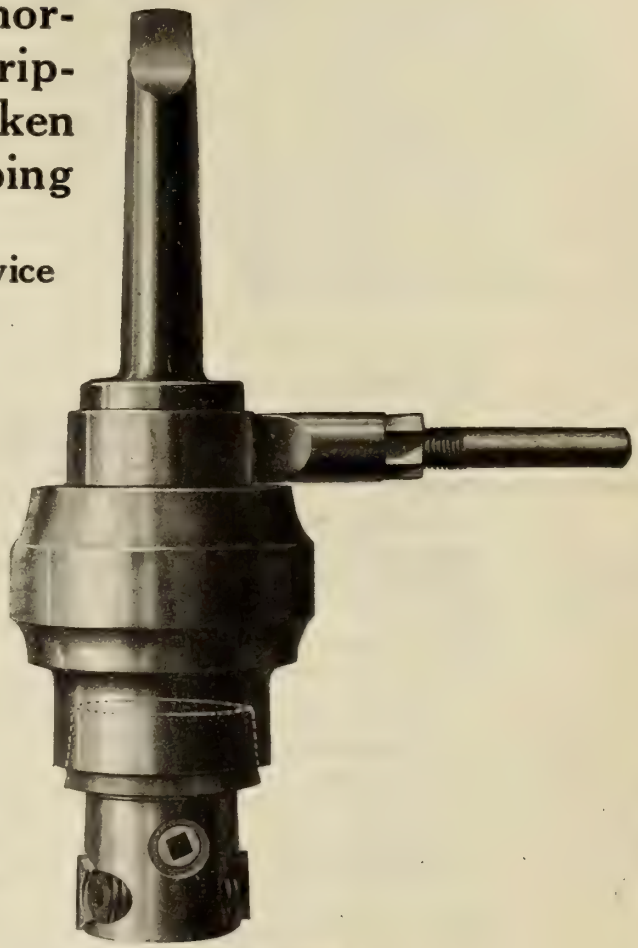
The Canadian Pacific Railway, Windsor station, Montreal, has awarded a contract for a 17-storey extension to the Chateau Frontenac Hotel, to a Montreal firm.

JARVIS
Friction Tapping Device

One man worked to overcome the enormous waste from stripped threads and broken taps on light tapping

The FD Tapping Device Resulted

This latest Jarvis invention has taken the friction out of tapping and put it into the



Cone Friction Drive

There it relieves all strain in driving the Tool. The pressure comes on the machine spindle that runs the Device.

Holes are tapped in the toughest metal, with broken taps reduced to the minimum, while stripped threads are entirely eliminated.

The tapping range is from 0 to 1-4 inch.

Here is a Tool that very thoroughly reduces Production Cost.

Jarvis Friction Tapping Device. Note size and location of the Cone Friction Drive.

Any Standard Jarvis Product Will Be Sent on Trial to Reliable Concerns. Jarvis High Speed Tapping Devices and Quick Change Chucks and Collets are carried solely by The Geometric Tool Company.

DIRECTORY OF DEALERS

THE Buyers' Directory of CANADIAN MACHINERY was originally intended to contain information regarding lines actually manufactured by our advertisers. We now carry the advertising of leading machinery dealers, some of whom represent scores of manufacturers in addition to being manufacturers themselves in some cases. This necessarily widened the scope of our Directory, but it would be impracticable to list all the lines handled by all the dealers. We recommend, therefore, if our subscribers cannot find what they want in our Directory that they communicate with the dealers whose names appear herewith.

Seven pages printed here each week for your convenience

Consult this Buyers' Directory when you want the names of reliable makers of machine tools, parts, steel, in fact any equipment you may need.

Is Your Factory Protected?

Eventually you will realize that *ordinary* firedoors with wood cores "protected" by light terne DO NOT afford adequate protection.

There is *only one* FIREDOOR which can meet every test successfully—and that firedoor is the "ALMETL." It is constructed of heavily galvanized corrugated steel — laid transversely and interlined with stout asbestos roll board.

The frame of 3/16" x 2½" Bar Steel reinforced by an extra heavy binder of galvanized steel, which forms a box for the panel and prevents damage to the door by trucks, etc.

THIS is the firedoor which will give you unnumbered *years* of protection and satisfaction.

APPROVED BY THE UNDERWRITERS

Our Department "A" will mail you descriptive literature and blueprints on request.

I. P. Morris Turbines in
Balancing Department

For Continuous Operation and High Efficiency Over a Wide Range of Power—

I. P. MORRIS TURBINES

Inquiries are invited from Hydraulic Engineers and Water Power Owners in any part of the British Dominions.

Turbine units built during the past year and now under construction, aggregate over 100,000 H.P., and range from 1,500 to 41,000 H.P. capacity each.

We are Sole Licensees for the manufacture of I. P. Morris Turbines in the British Empire.

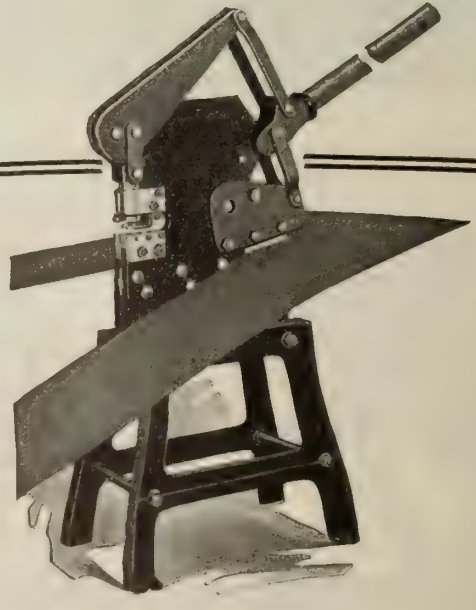
"CANADIAN"
HAND POWER PUNCHES AND SHEARS

All Canadian hand power Punches and Shears are made with "Armor Plate" frames.



This frame construction consists of a rolled steel plate having a tensile strength 7½ times that of cast iron. This strength permits of a machine much lighter and more compact than is possible with either cast iron or cast steel.

Let us know what your punching and shearing requirements are. We have an "Armor Plate" machine for the service. Remember our Armor Plate Air comprises power operated machines as well as hand power.

Vancouver St. John Winnipeg

Price vs. Service

Just "because they're cheap" is no reason why you should buy cast Clamps and Lathe Dogs.

They're dear at any price if not dependable and no *cast* product can be dependable for such service.

Williams' lines of drop-forged tools will never fail you and will last a lifetime. They're all guaranteed.

CLAMPS—11 patterns, in a wide range of sizes for every purpose.

SAFETY LATHE DOGS, Straight or Bent Tail, 1 or 2 Screws, 16 sizes.

DROP-FORGINGS

often cheaper than castings
— always far superior —

Franklin Die-Cast Parts in War Material

Meeting the War Needs of Speed and Accuracy

QUICK action and dependable material were necessary in the recent great war. Old methods of production were as useless as the old methods of attack and defense. The situation called for man power multiplied by ingenuity.

For speedy, decisive results our Government recognized that proper equipment for the millions could be had only by using the most modern and economical production methods. Franklin Die-cast parts were used in smoke and depth bombs, periscopes, airplanes and trucks, and for numerous other devices, which, directly or indirectly, were used to equip the Army and Navy.

In 1892 we originated the Die-Casting Process. For nearly thirty years we have been reducing the cost and simplifying the output in many fields of industry. The addition of a special process for the production of finished brass castings now enables us to offer parts in brass, bronze, aluminum, tin, lead and zinc base alloys as conditions require, thus meeting a still wider range of work.

FRANKLIN DIE-CASTINGS

PRESSES Number 18

(Photograph by courtesy of our customer)

Blanking, cupping and stamping electric light wiring device parts in the Arrow Electric Company's plant at Hartford, Connecticut. Steel, brass, copper and pressed paper stock, 1-64 to 3-32 thick is used. The company began to install "Bliss" Presses about 10 years ago. It required a high rate of production on a variety of small parts. It now has in operation over one hundred "Bliss" Machines and is getting the production it wants.

The Nearest Approach To Absolute Reliability in Belting Performance

Dominion Friction Surface Belting is the result of the combined experience of all our industrial rubber factories. It is the finished product of the finest materials put together with all the skill of the belt-maker's art. The in-built strength and pulley-gripping power of

Dominion Friction Surface Belting

make it the most dependable and economical for all drives. Every *Dominion Friction Surface Belt* installed means so much power conserved and so much more freedom from troubles due to stretch and slip. It will cost you nothing to have one of our belt experts study your belting problems and submit recommendations for your approval.

THE JOHNSON FRICTION CLUTCH

Install a Johnson Lineshaft Drive

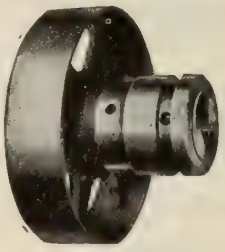
The practical experience of hundreds of our customers has established their belief in the Johnson Clutch Drive as the ultimate method of power transmission.

It replaces the countershaft, with its old fashioned tight and loose pulleys, and its troublesome overhead belting.

It avoids the expense of individual motors, and the waste of current they involve.

It substitutes reliable clutch control—economical in first cost, efficient in operation, durable under all kinds of service.

"We are still using Johnson Clutches with very good success and have had them installed in our Nut Tapping Department for about ten years and at least half of that time they have been running night and day. We are also very greatly pleased with their operation in direct drives from lineshafts to lathes and other machines in our Machine Shop Department."



The National Screw and Tack Co., Cleveland, Ohio.

An installation made ten years ago on American Tool Works Lathes. Still in perfect condition.

FRICTION CONTROL MEANS BETTER MACHINERY

We specialize in friction clutches alone and can supply the right clutch for any drive. Hundreds of standard sizes in stock to fit all shaft and pulley dimensions.

Cleco Pressure-Seated Air Valves

Bowes Air Hose Couplings—Cleco Never Slip Hose Clamps — Cleco Grooved Hose Nipples and Hose Clamp Tool

STYLE O.F. is an Outside Thread Female Pipe End. Made in sizes ⅜-inch to 1½-inch.

STYLE I.F. is an Inside Thread Female Pipe End. Made in sizes ¼-inch to 1½-inch.

STYLE H.F. is a Female Hose End with spiral shank to insert into the hose and has groove for the Never Slip Hose Clamp. Made in sizes ¼-inch to 1½-inch.

STYLE H.M. is a Male Hose End with spiral shank to insert into the hose and has groove for the Never Slip Hose Clamp. Made in sizes ¼ inch to 1½-inch.

STYLE O.M. is an Inside Thread Male Pipe End. Made in sizes ⅜-inch to 1½-inch.

STYLE I.M. is an Inside Thread Male Pipe End. Made in sizes ¼-inch to 1½-inch.

The Male and Female Ends of Bowes Couplings interchange in sizes ¼-inch to ¾-inch. Sizes 1-inch and 1¼-inch interchange. The 1½-inch ends interchange only [illegible]

BOWES COUPLINGS

[illegible] instantly connected or disconnected.
[illegible] air-tight under all pressures.
They quickly pay for themselves by stopping costly leaks.
[illegible] sizes most commonly used.
[illegible] no loose parts to be mislaid or lost.
[illegible] and will not rust.
[illegible] changes in couplings ¼-inch to [illegible]-inch.

CLECO AIR VALVES.

Style R.A. **Style P.O.** **Style A.**

Style P.O.—Made in sizes ¼ in., ⅜ in., ½ in., ¾ in., 1 in., 1¼ in., 1½ in., 1¾ in., and 2 in. Pipe Outlets. Inlets are one pipe size larger.
Style A—30° Angle Valves, are made in sizes ½ in., and ¾ in.
Style R.A.—Right Angle Valve, made in sizes ¼ in., ⅜ in., ½ in., and ¾ in.

CLECO GROOVED HOSE NIPPLES

Grooved Nipples when attached to the Hose with Wire Clamps as illustrated cannot "blow out." Wire clamp tool shown below applies the wires to hose.

The Lighting Hose Clamp Tool illustrated applies wire clamps at a cost of 1* cents each.

In stock: Riveting and Chipping Hammers, Air Drills, Emery Grinders, Sand Rammers, etc.

Use Annealed Wire No. 14

IMPORTANT—The Small Leaks in your "AIR LINE" mean serious loss in DOLLARS. Have you any idea of the amount of "Air" wasted in small leaks at your connections? Air Leakage through 1-16 in. opening equals 5.32 cu. ft. per minute at 80 lbs. It will pay you to install Bowes Couplings and Cleco Valves, which will stop costly leaks.

Bulletins Nos. 46, 48 and 51. mailed on request.

THE MODEL HOSE LINE illustrated shows correct styles of couplings and valve to use and proper way to attach the Cleco Never Slip Hose Clamps to Bowes Couplings. No "blow-offs" can occur when "Cleco" Clamps are used.

FORD-SMITH

DISC

Grinders

High-Class Made-in-Canada Machines

MACHINES which bear a reputation for doing quicker, better work, and whose upkeep expenses are practically nil, merit investigation.

Such machines are Ford-Smith Disc Grinders; every model of the Ford-Smith line—and there's a model for practically every purpose—is designed to give *quality* production as well as *quantity*.

Before leaving the factory all Ford-Smith Grinding Machines are subjected to a series of exacting tests, covering every detail of their construction. These tests *prove* that the machine is capable of filling all our claims.

Many manufacturing operations show possibilities of exceptional economies by the use of suitable grinding processes. Have one of our engineers call and see just what saving grinders would effect on your work.

Any information with regard to Ford-Smith Grinders will gladly be furnished.

Send for our latest Disc Grinder Bulletin.

Automotive Industry Watching Costs

IT TOOK a price reduction to "sell" automotive manufacturers on the idea (which they all know in the backs of their heads) that when you can't make a profit by increasing or maintaining prices—you can still make a profit on reduced prices, by

1. **Watching costs.**
2. **Increasing production (which is the same as lowering overhead per unit.)**

What a crisis showed one group of manufacturers, can be adopted to the advantage of other manufacturers (without the crisis, perhaps) if they will profit by the experience.

GTD has maintained and proved by many experiences that in the work of screw-threading, GTD tools, particularly *"Gun"* Taps, *"Acorn"* Dies and GTD Gages, reduce costs and increase production.

We will gladly supply you with details regarding these GTD tools. Just clip the coupon and send it in. No obligation of course.

This is the *"Gun"* Tap

Its features are a shearing cut—no chips to clog flutes and break tap — shallow flutes giving great strength —requires one-half power necessary to drive ordinary tap — cuts true to size until ground down to last three or four teeth. The *"Gun"* Tap will outlast two or three ordinary taps, and *wears out before it breaks.*

This is the *"Acorn"* Die

It has a positive, concentric adjustment on all cutting lands, making it practically a solid die, and insuring great accuracy. By means of its various holders, it is adapted to all kinds of machines using threading dies, lathes, drill presses, hand or automatic screw machines, turret lathes, bolt cutters, etc. Its life is many times that of the ordinary die.

GTD *Gages*

There is only one standard inch. The U. S. Government sets that standard — GTD gages accurately reproduce it. A certificate of the Bureau of Standards will be furnished with any of our gages, when requested. GTD manufactures both thread and cylindrical gages and designs complete gaging equipment for any product. GTD gages increase production and lower costs. Our gage experts are always at your service.

Vitrified
Grinding Wheels

These wheels are the most generally used and give the greatest satisfaction for the majority of grinding jobs, since the bond is less affected by heat and may be used wet or dry. The Vitrified process affords a wider range of grades, the wheel is more open in texture and more free-cutting. It takes from 20 to 30 days to carefully manufacture a wheel by this process.

Silicate
Grinding Wheels

Silicate Wheels may be manufactured in 24 hours. They are often substituted for Vitrified wheels when it is inconvenient to wait the longer time required to manufacture wheels by the Vitrified process. These wheels derive their name from the large portion of silicate contained in the bond. We manufacture Silicate wheels with or without web as specified by the customer.

CANADIAN HART WHEELS

Made-in-Canada

IN ALL grinding, the main problem is found in the dissipation of the heat generated. A wheel manufactured of proper abrasive grains, of a proper degree of hardness, will produce a minimum of heat, and this heat will be dissipated with the least injury to the wheel or material ground.

Once you find the correct grade and grain, you want to feel **sure** that **every** future wheel you order will give the same satisfactory service as the first.

The unvarying uniformity of Canadian Hart Wheels is a recognized fact which more and more shops are coming to depend upon. **Why not you?**

Tell us what you have to grind and we'll tell you the wheel to use.

CANADIAN HART PRODUCTS

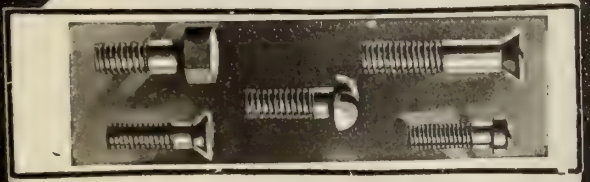
"Best Machine Encountered In 16 Years' Experience In Pipe Cutting And Threading"

LANDIS

Three years on the job at the John Maneely plant in Philadelphia.

This Landis is cutting and threading 5-in wrought steel pipe—pitch of thread 1/8in.—cutting through 1/4 and 3/8in. wall. Eight pieces finished every hour from floor to floor.

This firm finds the Landis "the best machine" principally because of its arrangement of chasers which are tangentially disposed to the work. Thus ideal cutting conditions and longer chaser life are obtained.



Profitable suggestions on request.

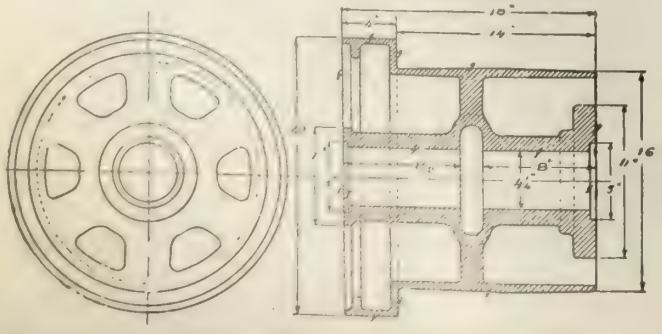
Finishing a 16 Inch Pulley in 60 MINUTES



Speaks Well For "STEINLE" Design and Construction

It is a demonstration of the ability of the Steinle Heavy Duty High Power Turret Lathe to pull maximum cuts at as high cutting speeds as the best tool steel will stand.

Especially is this made apparent when it is realized that the surface machined on each pulley is 1,446 square inches, the surfaces machined including turning the 16-in diameter, turning and facing the 20-in. diameter flange, boring the hub, and counterboring and facing one end of hub. All surfaces received a roughing and finishing cut.

Steinle lathes are built and equipped to handle with equal facility large or small castings or forgings or bar work up to 6¾ in.

Why not send us your blueprints so that we may show what "Steinle Saving" means as applied to your work?

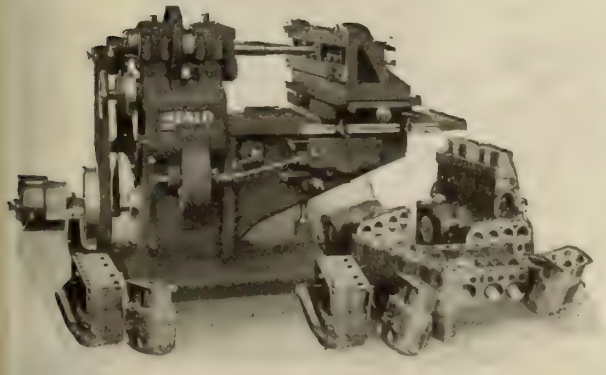
HEALD

The Map of Opportunity

The registration figures in this map are for 1920. With a total of 403,000 registered cars and only approximately 15 concerns Heald-equipped, see what an opportunity is open to machine shops, automobile repair shops and welding concerns in the most active mechanical business in Canada today which is cylinder regrinding.



Every registered car in the above map is a regrinding possibility. Think what this means, when 12 holes a day will bring handsome returns for the investment. 18 to 20 holes is the usual production.

Ground cylinders save gas and oil; they increase the power and give many more miles per dollar expense. At this particular time such economy appeals to the owners of both low and high-priced cars. No other motor proposition offers the opportunities at the present time.

Make any investigation among the neighboring garages. Ask the auto owners you meet. Look over the proposition thoroughly. Satisfy yourself of the success before you start, and then remember that as the heart of the regrinding business is in the regrinding machine itself, you must obtain the best.

The Heald will not only take care of every size and description of block that comes in, faster and with better results than anything on the market, but the fact that there are 3,000 among satisfied customers, with all the motor manufacturers that grind using them exclusively, is proof enough that no other machine will do.

We have a book on the vital facts of the regrinding business and would like to send it to your address. May we have it?

BELLEVUE FURNACES

Enable the Operator to Speedily Obtain an Intense, Uniform Heat.

A distinctive feature of Bellevue Furnaces is the accurate way they respond to the will of the operator. They speedily develop an intense heat and are always under accurate control. Bellevue Furnaces are simple and economical to operate. Combustion is perfect and no flames come in contact with material. For oil or gas in seventy-nine different styles or to your order.

THE ELLISON CATALOGUE
of Electric Control Gear.

The STANDARD for SIMPLICITY and CORRECT DESIGN

The Ellison Catalogue is a practical text book on Electric Motor Control Gear. It consists of separate lists, each complete in itself, dealing with a particular piece of apparatus and illustrated by photographs and diagrams. The lists give precise information concerning the apparatus with prices and shipping data. Overseas Engineers should lose no time in obtaining a copy of this useful Catalogue.

Portable Valve Seat Planer

Constructed to Stand Heavy Work

Our latest Portable Valve Seat Planer is of a rigid construction capable of withstanding heavy work without spring or strain. It will easily plane as heavy a cut as is required for valve seat work—facing off, at one cut, deeply worn valve seats.

Full particulars of this and any other Underwood machines will gladly be forwarded upon request.

MEZZO

"The Greatest Advance in Twenty Years"

"MEZZO" is new but the field for "MEZZO" is old.

Perhaps you have often wondered why some one did not produce a drill for the shop which could not obtain production with Carbon Drills and yet was not equipped to realize full efficiency from High Speed Drills and consequently could not use these drills economically.

To meet the demand for a drill which would stand higher speeds and heavier feeds, giving far greater drilling capacity than Carbon Drills and still sell at a moderate price, we present

MEZZO

"MEZZO" has been characterized as the greatest advance in drill manufacture in the last twenty years. This drill performs best at speeds and feeds which would soon burn the point of a Carbon Drill, and at these speeds and feeds "MEZZO'S" drilling capacity has astonished many of the wiser heads in the cutting tool field.

Heating the cutting edge of "MEZZO" even to a dark blue color will not draw its temper. In fact "MEZZO" works at its best efficiency this way.

We are proud to be once more a pioneer—a leader in this new field for we know that "MEZZO" will maintain the "Cleveland" reputation for quality and solve the problems confronting many shops.

Write for the "*Story of Mezzo.*" It is a most interesting little booklet which gives full information on "MEZZO" and its uses.

Norton Alundum and Crystolon Grinding Wheels

FOR SPECIAL OPERATIONS.

For the special job, the one where the corner of the grinding wheel must stand up, or where a face shape conforming to the shape of the work ground must be maintained, or where specially formed tools must be ground accurately, we may be able to suggest to you methods which will result in faster production, greater accuracy and better finish for your work.

A difference of one grain size or one grade of the wheel may give you surprising results. In addition, the artificial abrasives ***"Alundum"*** and ***"Crystolon"*** which we make ourselves in the large furnaces at Chippawa, are designed to offer the required properties for just such work as you have.

May we assist you in selecting the right grinding wheels for your shop?

BROWN & SHARPE

MACHINISTS TOOLS

Vernier Caliper

Daily throughout the world higher standards of accuracy are being set. For seventy years Brown & Sharpe Tools have satisfied the most exacting demands of the best mechanics.

The Vernier Caliper is one of a large variety of Machinists' Tools that is gradually becoming a common tool for the mechanic. It meets the present-day requirements for measurements to the thousandth part of an inch. Perfectly balanced and easily adjusted, it is suitable for taking inside or outside measurements. It is a modern tool that finds favor with the modern mechanic.

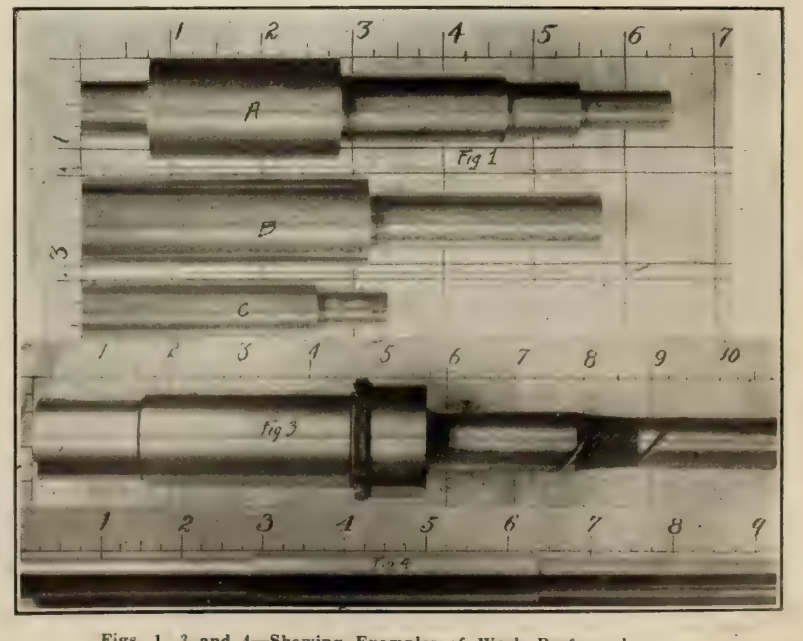
Various Examples Of Cylindrical Grinding

Tolerance on Ground Work Can Be Very Close—Miscellaneous Parts Which Have Been Ground Successfully—Roll Grinding Machinery—Special Machine for Grinding of Paper Dryers

By H. A. WILSON.

FROM time to time we have published articles of a varied nature in connection with grinding problems in the machine shop, and, perhaps, some of the observations in this matter will touch on subjects that have been referred to before. To go back to the early conception of grinding, it will be realized that grinding was only used to remove stock from hardened pieces of steel, such as sharpening small tools, smoothing up surfaces of chilled cast iron, etc. In these early days natural abrasives only were used and they were of uncertain hardness and of miscellaneous "grits."



Since those days we have learned to manufacture the artificial abrasives whose grits and grades are fully controlled and understood. Grinding machines have also developed, and the field of grinding operations has increased by leaps and bounds, until today it has become a very exacting science which is employed in a multitude of production operations dealing with various kinds of metals. In attempting to take up instances of cylindrical grinding we have a very broad field and will confine ourselves largely to instances of production work of an interchangeable nature. Thus we will pass by the many interesting jobs done in the tool room on the tool and cutter grinders.

In production work we have various classes of metals to deal with such as cast iron, chilled iron, machinery steel, high carbon steel, and high speed steel. These latter two metals are often ground both before and after hardening. Each and every job requires careful calculation in the way of designing jigs and fixtures, also the grains and grades of stones used must be intelligently selected. In many cases a product specified as being "hardened and ground." The general procedure is to rough machine such articles as generator shafts for automotive generators, pins, plugs, arbors, etc., on an automatic lathe. The latter lathe produces these pieces only a few thousandths larger than finished dimensions. They are hardened by the process best suited to the metal being dealt with, then the parts are finished on the grinder. Sometimes bar stock of machinery steel, drill rod, and various other metals are used with little or no preliminary machining. As readers are familiar with the appearance of a Pratt & Whitney cylindrical grinder, we need not illustrate the machine itself, but will proceed to show some work completed on such grinders.

Fig. 1 shows three examples of work done. The limit of tolerance is plus or minus .00025 inches. Piece A is not ground on the two small diameters shown to the right. This work can thus be set up and held in a chuck, with or without a tail centre to steady it, or it can be supported between two centres and driven by means of a dog. Twenty pieces per hour are produced. The scale shows the dimensions of the piece very closely. Piece B was ground all over but has to be changed end for end to allow for that part under the driving dog to be finished. The piece is supported between centres. The production is 40 pieces per hour. Piece C is the smallest of the three and is handled similarly to piece B. Owing to the smaller diameter less metal is removed per cut and the production is 30 pieces per hour.

Fig. 3 shows a shaft with five shoulders. The limit is plus or minus .00025 inches. A production of fifteen shafts per hour is maintained.

Fig. 4 shows a shaft 9 1-8 inches long. The limits are plus or minus .0003 inches. A production of twenty-five to thirty shafts per hour is maintained. The stock removed is .008 to .01 inches.

Figs. 1, 3 and 4—Shewing Examples of Work Performed.

*We are indebted to the Pratt & Whitney Co., Hartford, Con., for data and illustrations covering Figs. 1, 2, 3, 4, and 5, also the top sketch in group Fig. 6.

The data on work shown at Fig. 6 were furnished by the Brown & Sharpe Co., Providence, R.I., while the remainder of the illustrations were supplied by the Dominion Engineering Works, Lachine, P.Q.

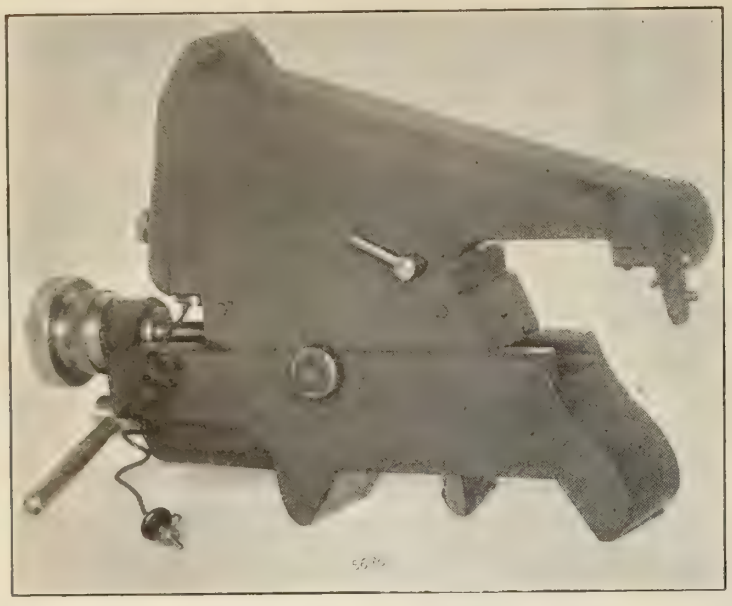


Fig. 5.—Automatic Sizing Device Electrically Controlled.

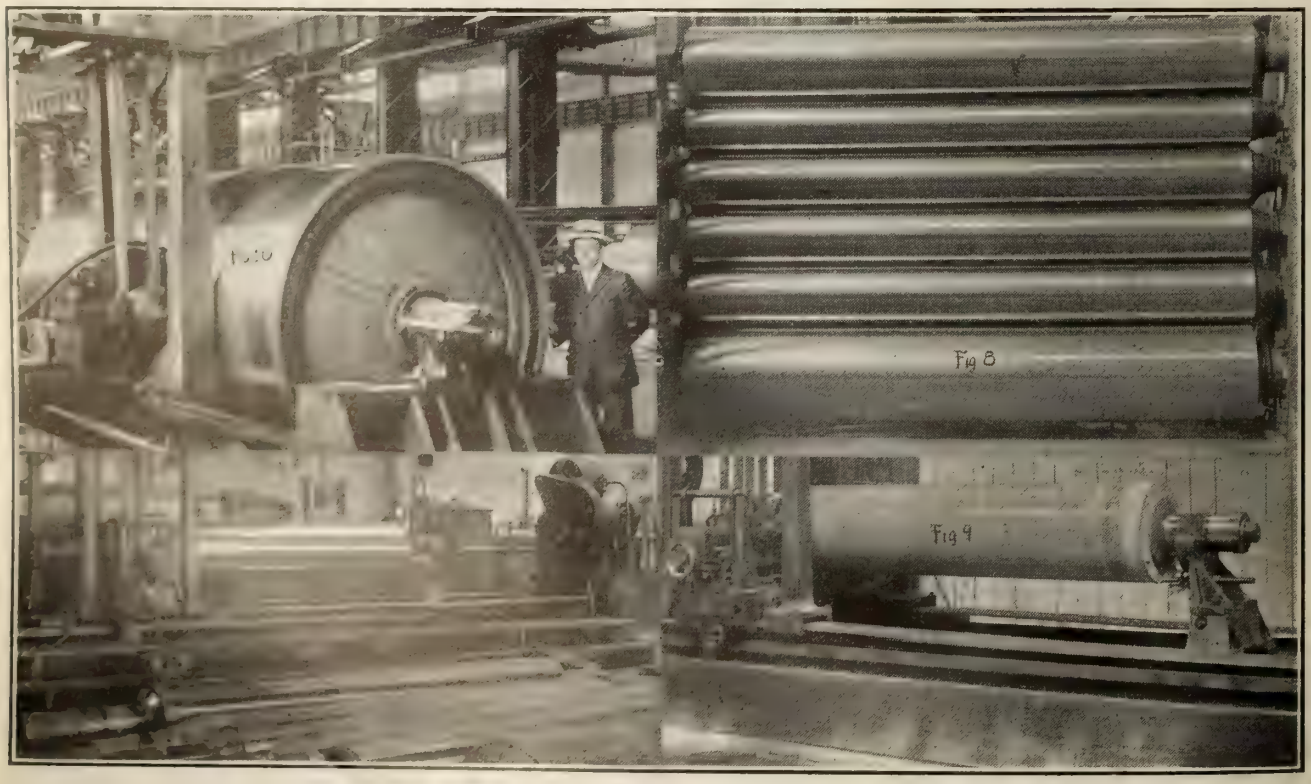

Fig. 5 depicts an automatic sizing device which is electrically controlled. This apparatus can be arranged to knock off the feed when the proper size is reached. There is a micrometer adjustment on the device and it is an extremely efficient apparatus. In addition to the accuracy obtained by its use, it enables one operator to take care of several machines without any possibility of spoiling work.

Fig. 6 shows several examples of work done on standard grinders. Example A is ground with an Alundum wheel 12 in. diam. x 1 in. hole x 5 in. face. The wheel is 38-80 grain, grade L. The wheel speed is 6,500 ft. per minute and the speed of the work is 30 ft. per minute, with a table travel of 40 in. per minute. Because of the threaded stud this piece can be gripped by a dog in such a way that the wheel can pass over the entire surface to be ground from end to end. The production on this piece is 35 per hour. The material is machinery steel and the low and high limits in diam. are .3745 in. and .375 inches respectively, as shown in the cut.

Example B is another machinery steel piece. A wheel of similar dimensions and similar grain to that used on example A is employed but the grade of the wheel is K. Similar wheel speed, speed of work and table speed are also used. This piece is ground to a point beyond the half-way mark; is then taken out, another piece inserted, then the driving dog is placed on the ground end of the first piece, afterward the piece is replaced in the machine and the balance of the surface ground. The sequence of operations is then repeated throughout the entire lot. The production is sixteen pieces per hour.

Example C is a similar piece to example B, but is shown in order to draw attention to an interesting point. The Alundum wheel is 12 in. x 1 in. x 5 in., same size as used on previous examples A and B. The wheel is 38-80 grain and grade K. The wheel speed is 6000 ft. per minute and the speed of work is 35 ft. per minute. Table travel is 40″ per minute. Now we wish to draw attention to the production of eighteen pieces per hour. This is a larger piece than example B and yet the production is greater. The explanation is that long pieces of small diameter must be ground more slowly and carefully, than pieces of the same length but larger diameter, in order to prevent springing and therefore an inaccurate job.

Example D is only ground on the smaller diameter at one end. A carborundum wheel 12 in. x 1 in. x 5 in.—401—N at 6,000 ft. per minute was used. The average production is one hundred and twenty per hour. The use of the independent automatic cross feed by which the wheel can be fed to bring the piece to any predetermined size, is the reason for the high rate of production on this work. The feed is automatically thrown out when the piece is

Figs. 7, 8, 9, and 10.—Text Matter Explains Each View.

the proper size. As before stated, the table is stationary and a wheel broader than the length of the surface to be ground, is used. A girl operator ground four hundred and eighty of these pieces in three hours which is a record production. This means 2 2-3 pieces per minute or one piece every 22.5 seconds.

Example E is one of internal cylindrical grinding. The piece has four gears cut on it and all four had to run true with the centre. A variation either way of only .00025 inches in the diameter of the whole was permitted. The material was special steel, hardened. The Alundum wheel used was grain 38-80, grade J and was 1 1-2 in. diameter x 3-8 in. bore x 5-8 in. face. The wheel speed was 4000 ft. per minute, (approximately 10,200 r.p.m.), the work speed was 120 ft. per minute, and the table travel 30 inches per minute. The production was one piece every twenty-five minutes, trued on the pitch line.

Example F is an excellent illustration of small size work ground to close limits. The rate of one hundred and fifty pieces ground in 10 hours with .012 inches of stock to remove and a final finish size of .250 inches with a plus and minus limit of one ten thousandth are rather unusual. The work was done on a No. 10 plain grinder. The wheel used was an Alundum wheel 12 in. x 1 1-2 in. x 5 in.—grain 38—36 grade C. The wheel speed was 5500 ft. per minute. The work is driven by a driver, through keyway on the end of the piece which allows wheel to pass completely across the work.

Example G was ground without any stopping of any part of the machine. At the end of the second pass of the wheel, the centre was pulled back, the piece was taken out while still revolving and a blank inserted. The piece was driven by the squared end and the wheel passed over the work from end to end. The wheel used was an Aloxite 401 GRN, 12 in. x 1 in. x 5 in. at a speed of 6000 ft. per minute. The work revolved at 400 r.p.m. The table travel was 39 inches per minute. The average rate of production is 1000 pieces in 3 hours and 43 minutes, which otherwise expressed is 4.48 pieces per minute or one piece every 14.28 seconds.

Example H was ground by the use of the independent automatic cross feed, mentioned in connection with example D, and with the table stationary. The wheel used was an Aloxite 40 in. at a speed of 6,000 ft. per minute. The speed of the work was 15 ft. per minute. In this case also, a girl operator made the record production of 500 pieces in 3 hours and 40 minutes which is at the rate of 2.27—plus, pieces per minute or one piece every 26.3 seconds.

Example I is a similar piece of work to Example H. The wheel used was an alundum 38—46, K—14 in. X 3 in.X 5in. at a speed of 6,000 ft. per minute. The speed of the work was 45 ft. per minute, and the table was stationary. The production is 88 pieces per hour, one piece every 1.4 minutes.

The previous examples of work have been of the small piece type, and we will pass on to larger work, which is being done in Canada to a great extent, namely the grinding of rolls for paper mill work.

Fig. 7. represents a Farrel Roll Grinding Machine in the plant of the Dominion Engineering Works, Lachine, P.Q. This machine is used to finish grind the calender, granite, and other rolls in use on paper machines. The machine is provided with two grinding spindles. One of the unique features is that the ways on the bed of the machine, along which the wheel carriage slides, are inverted and of the removable type, thus they shed instead of retain the grit and impurities that cause wear. In addition the ways are provided with guards, as also is the feed screw, to better protect them from grit and water. The feed screw is equipped with thrust ball bearings at both ends. A circulating pump for lubricating oil forms part of the regular equipment of the machine.

This pump automatically lubricates, and cleanses, by a constant flow of oil, the ways and feed screw of the machine. The wheel carriage is equipped with an automatic reverse, thus travelling backwards and forwards over the roll surface automatically. The wheels are mounted on the swing-rest principle

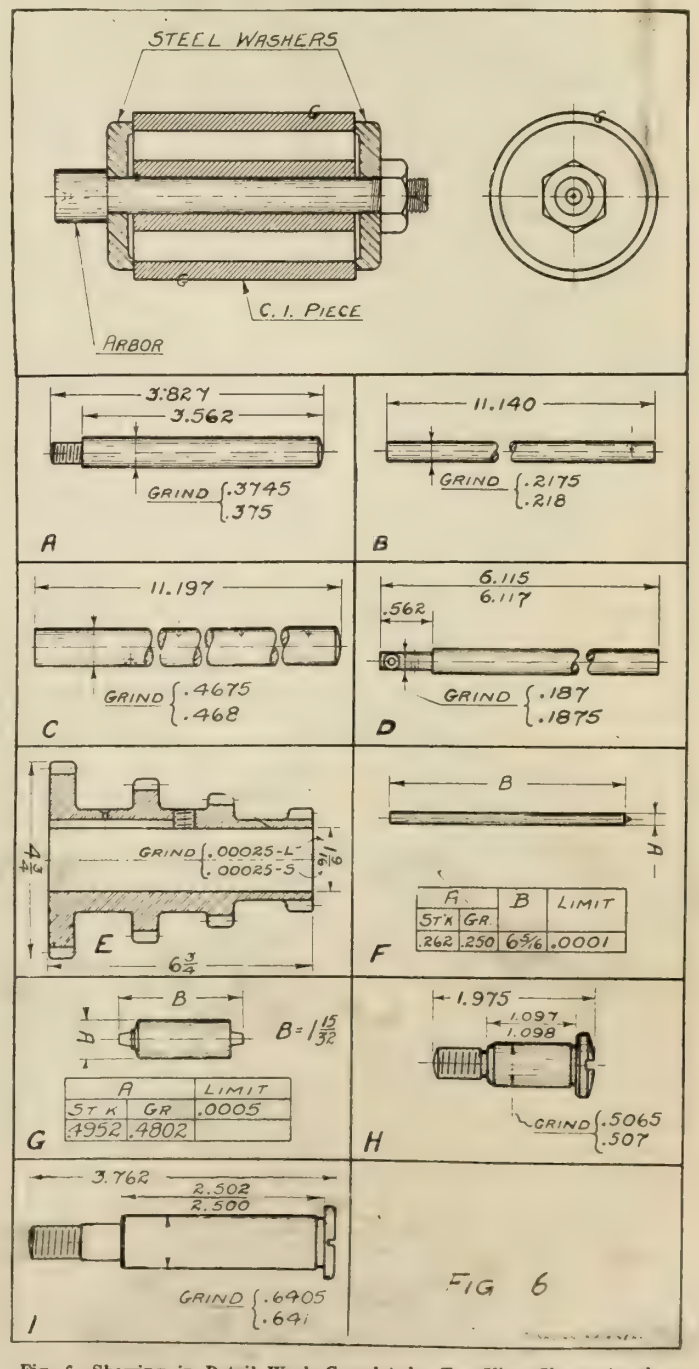

Fig. 6—Showing in Detail Work Completed. Top View Shows Another Piece Ground Successfully.

which insures extremely accurate work. Two electric motors drive the two grinding wheels. A third motor is mounted on the machine and is connected to the driving spindle. Thus the machine is entirely electric driven and self-contained.

The grinder is equipped with a patented Vine roll crowning device consisting of a guide, or former, secured to the side of the bed. This former is seen in the photograph. The top of this guide is finished in the arc of a circle upon which rides a shoe controlling the lifting rods which are compounded and connected to the grinding wheel housing on either side. This system of connecting by adjustable levers, or rods, enables any desired crown to be obtained, the crown being determined by the lift thus conveyed to the wheel housings.

The calender rolls ground on this machine, are of chilled cast iron. The rolls have to be finished with the utmost care, as when assembled in a paper machine it is these rolls that impart a smooth, uniform surface to all paper produced. Every calender roll must be ground absolutely parallel, except the bottom roll of a stack, which has to be crowned. The necessary crown varies in different stacks of rolls, all the way from half a thousandth to thirty thousandths. The crown is required to correct deflection of the bottom roll, as this roll carries the weight of the stock During the grinding process rolls are always rotated on their own journals and never on centres or at other points than journals. These rolls are from 12 inches to 26 inches in diameter. In Fig. 8 is shown a set of calender rolls stacked in the shop, in position exactly as they would be when assembled in the paper machine. These rolls are 166 inches face length. They are stacked in this way in the shop in order that the "light" test may be applied. When so stacked an electric light is passed back of each joint. If no light can be detected the rolls are parallel. If there is an opening of only a few ten thousandths it is greatly magnified by the light on the shiny surfaces and the error appears to be much greater. This is one of the most sensitive tests that can be applied. The crown in the bottom roll is calculated previous to grinding, and after the weight of the other rolls has been ascertained. This company has demonstrated its ability to calculate the amount of crown, place that crown on the roll and then have the rolls pass the "light" test, time and time again.

The wheels used on chilled calender rolls for roughing are of the carbo-vitrified type, grain 36 or 40, grade P-4" diameter x 1" hole x 5½" face. Carbo-shellac type of wheels are also used. For finish grinding and general grinding work, grain 70, grade P, wheels 3" x1"x5" are used. The grinding wheel speed is 1,500 r.p.m., the roll speed is 100 r.p.m. and table traverses five feet per minute.

Fig. 9 shows a granite roll being ground on the same machine. These granite rolls are used as press rolls in many types of paper machines. The grinding operations are for the most part similar to those on calender rolls. However, granite is very brittle and will crack if heated unevenly. How sensitive it is will be appreciated when recently a small brass ring which was rather hot, (not red hot,) was laid upon a granite roll and a piece flew out from the face of the roll. The granite rolls have solid steel shafts inserted in them, and on these shafts are mounted semi-steel or steel journals, all being held together by nuts on each end of the shafts. The shaft is heated moderately hot, put in place, then the nuts tightened lightly and the shaft allowed to cool. The journals are ground true and then the granite rolls are revovled on these journals when being ground. The wheels for roughing granite rolls are 20M-G3 carbo-vitrified. The finishing wheels are 40M-G3 carbo-vitrified. Speed of wheel, and speed of work, also travel of table, are similar to that in the case of the chilled calender rolls.

Fig. 10 shows a grinding machine designed and built in the shop of the Dominion Engineering Works, for the grinding papers dryers. As will be seen the machine has only one grinding wheel arbor. This is because of the comparatively large diameter of the dryer shells. The trend of modern designing has called for dryers from four to six feet in diameter, and 14 feet and over in length. For example the paper machines built in this shop for the Laurentide Co., called for dryers six feet in diameter, 166 inches face length. To take care of such extremely large diameters and lengths, this machine was designed. The modern paper machine of any size calls for from 30 to 40 dryers and thus the grinding of these dryer cylinders really becomes a manufacturing proposition. Fig. 19 shows a collection of dryers for one machine. These dryer cylinders are of grey cast iron on the face, and when being ground are as in the case of press calender rolls, revolved on their own journals. The wheels used are Carborundum grain 20, grade S, 36" dia. x 3" thick.

Other types of grinding done on the Farrel grinder somewhat out of the ordinary are also interesting. When brass rolls are ground, wheels with grain 60, 4" x 1" x 1½" are used. These wheels are of the carbo-shellac type. In grinding steel rolls, Aloxite wheels are used 36-3-K83 for roughing and 70-3-K83 for finishnig. When Rubber rolls are ground in general work a Carbo-shellac grain 40, wheel is used 4" x 1" x 5½". But in hard rubber rolls requiring a fine finish a carbo-shellac grain 70, 3in. x 1" x 5" is used. The handling of such large rolls to and from the machines is interesting. A railway siding runs directly into the shop and in front of the grinding machines. Rope slings are used on the finished work which is all handled by a system of electric cranes. Another interesting feature is that extremely accurate micrometer measuring devices are used to measure and gauge rolls.

Thus it is shown that cylindrical grinding is applied to all classes of work from the smallest to the largest, and to various kinds of material. The art of grinding is keeping pace with modern progress, and forms one of the most varied and interesting lines of machine shop practice of the present day.

WELDING BY CLOCKWORK

In shipbuilding and in many engineering operations, it is necessary to fix brass studs and other small parts to iron plates. This operation is usually performed by drilling holes in the plate, each hole being drilled separately. By means of an ingenious invention recently perfected by a British firm, the process is carried out in a few seconds by electric welding. The working of the machine is almost entirely automatic from the moment the stud is placed in position. Each size of stud requires a different time for welding it to the plate, and the machine can be set to give exactly the period required to make a perfect weld. The tests which have been made proved that the machine is able to weld 120 brass studs within an hour. It might be thought that welding does not give such a firm arrangement as screwing the stud into a hole in the plate, but when the welded stud is hammered the brass will break before the weld yields. Another advantage of the machine is that work can be satisfactorily carried out by semi-skilled labor.

NEW DEVICE FOR CRANE OPERATION

In the operation of large cranes used in building construction or for dock work it is generally necessary to have two men engaged, one working the controllers, and the other stationed at some convenient point to signal to the first. With the aid of a device invented in Great Britain it is possible to dispense with one of these men. The device consists of a portable electric controller which can be slung over a man's shoulder and can be supported by means of a long pointed leg. This controller is connected by means of a strong flexible cable with special controlled gear operating the crane motors. The user has merely to press certain buttons on the controller to make the crane go through all its usual evolutions. Thus the operator can stand at any point convenient for observation or he can walk about from one point to another so as to secure a complete supervision of the working of the crane. This invention should be of the greatest assistance in saving labor in docks and on construction work generally.

Elements Of Machine Design-Lesson No 3.

Continuation of Lesson From November 17th Issue—We Now Go Into Actual Problems, Showing How They Are Solved—Formulae of Importance and Charts

*By L. T. RUTLEDGE.

CONTINUING the lesson on the column from the November 17th issue, we will next take up the procedure in design. When Rankine's formulae in the form given in the previous lesson is used to determine the proper section of column to support a load "P," it must be understood that the quantity "S" is the total unit stress resulting from the combination of direct compression and the bending stress. For a given factor of safety a maximum permissible working value of "S" will be laid down in the specifications furnished. In any problem the unsupported length will be given in inches and when the material in the column is known along with the condition of the ends, then the value for the constant "k" will be selected. But even with all this information supplied, we still have the unfortunate condition, namely that there are still two unknown which are the quantities "A" and "r." We have just one equation and the usual thing is that one equation solves for one unknown. The value for the "r" will always depend on the dimensions that determine the value of "A." This condition has always seemed to introduce difficulty for the student or designer. It has been the writer's experience to observe that the theory and method of solution for columns are forgotten much more quickly than for any other type of problem.

The easiest way out of the difficulty is to adopt the method of solution known as the method of trial and error. Assume a section whose area and radius of gyration are known or can readily be found by the regular methods. Then introduce these values along with the other known values into the right hand side of Rankine's equation which will then give a value for "S" which is the resulting unit stress. If this value is close to but not greater than the maximum value allowed in the specifications then the first choice of section will satisfy the requirements of the problem and the problem may be considered as solved. But if the value for "S" is greater than the permissible value, then a second trial will have to be made. The good designer seldom has to make more than two trials. The result obtained in his first trial guides him in the choice of section for the second trial.

Example 1.—A machine weighing 8 tons is temporarily placed on a machine shop floor that is already carrying all the load the city building by-laws will allow. As an emergency measure the floor is to be shored up by a Douglas Fir stick of timber which is really a short column. The ends are square and flat and a perfect bearing is provided. The column is 15 feet long between the two bearings and it is unsupported for the entire length. What section of column is necessary to keep the maximum stress in it below but close to 800 pounds per square inch?

Solution — Given P=8 tons=16,000 lbs.; l=15 ft.=180 ins.

The material is wood and the ends are square and flat, then $k = \frac{1}{3000}$

As a first trial assume a section 6 in. x 6 in., whose area is 36 sq. ins.

$$r = \sqrt{\frac{I}{A}} \quad \text{and} \quad I = \frac{1}{12} bh^3$$

$$\text{then} \quad r = \sqrt{\frac{1}{12} \times \frac{6 \times 6^3}{36}} = 1.732$$

$$\text{and} \quad \frac{l}{r} = \frac{180}{1.732} = 104$$

Substituting the values in Rankine's equation we have

$$S = \frac{16000}{36}\left\{1 + \frac{1}{3000} \times (104)^2\right\}$$

$$= \frac{16000}{36}\left\{1 + \frac{10816}{3000}\right\}$$

$$= 2047$$

This gives the resulting stress to be 2047 lbs. per sq. in., which is much greater than the maximum of 800 allowed.

As a second trial, assume a 8″ x 8″ section. Its "A" = 64 sq. ins.

$$I = \frac{1}{12} \times 8 \times 8^3, \quad r = \sqrt{\frac{I}{A}} = \sqrt{\frac{1}{12} \times \frac{8 \times 8 \times 8 \times 8}{64}}$$

$$= 2.3$$

Then $\frac{l}{r} = \frac{180}{2.3} = 78$ and

$$\left(\frac{l}{r}\right)^2 = 78^2$$

Now on substituting in Rankine's formula, we have

$$S = \frac{16000}{64}\left\{1 + \frac{1}{3000} \times 78^2\right\}$$

$$= 755 \text{ lbs. per sq. in.}$$

This value is so close to the permissible working stress that we may consider the section 8 in. x 8 in. as satisfactory. Therefore a 8 in. x 8 in. x 15 ft. 0 in. Douglas Fir timber dressed four sides is the required column to support the floor at the place where the dead load of 8 tons can be considered as concentrated.

The student should observe from the arithmetical results obtained how rapidly the stress diminishes when the area of the section is increased. Here we did not double the sectional area yet the stress was decreased almost to one-third. This extra amount is due to the reduction in the value of $\frac{1}{r}$ which is in turn due to the increase in the value of the radius of gyration. Had we selected a section 6 in. x 8 in. the area would have been increased from 36 to 48 but the $\frac{1}{r}$ would have remained the same since "r" would be unchanged. This is

*The author is Professor of Mechanical Engineering at Queen's University, Kingston, Ont., and should any reader wish help in any problem on mechanical matters, Mr. Rutledge will be only to pleased to offer assistance. To save time, write direct to Kingston, explaining your trouble in detail.

an important consideration and it may be beneficial to show this in detail.

"r" is the least radius of gyration and is obtained from the least moment of inertia about an axis through the centre of gravity of the section.

$$\text{The least } I = \frac{1}{12} bh^3$$
$$= \frac{1}{12} \times 8 \times 6^3$$
$$\text{and } r = \sqrt{\frac{I}{A}} = \sqrt{\frac{\frac{1}{12} \times 8 \times 6 \times 6 \times 6}{8 \times 6}}$$
$$= 1.732$$

which is identical with the value used in the first trial.

Application of Theory to Steel Columns

Rankine's formula, as we have it, is expressed thus:

$$S = \frac{P}{A}\left(1 + K\frac{l^2}{r^2}\right)$$

or it may be written—

$$\frac{P}{A} = \frac{S}{1 + K\frac{l^2}{r^2}}$$

Where $\frac{P}{A}$ is the average allowable stress per sq. in. suiting the conditions of the design and which we may denote by "p" so that the formula may be written

$$p = \frac{S}{1 + K\frac{l^2}{r^2}}$$

For a factor of safety of 4, the permissible unit stress is usually taken as 16,000 lbs. per sq. in. but in the case of mild steel columns where secondary stresses are introduced due to various causes, extra provision has to be made. The causes of the secondary stresses are as follows: (a) stresses due to eccentricity of end connections; (b) stresses due to flexure of the unsupported parts between lattice bar connections; (c) stresses due to eccentricity of lattice bar connections; (d) stresses due to poor workmanship.

These secondary stresses are independent of the value of $\frac{l}{r}$ and the only way they can be provided for is by making an allowance in the value of "s" in the formula. Instead of assuming the value of 16,000, the more usual and better practice is to take three-quarters of it as the value, that is, assume 12,000 as the value to be introduced into the formula for "s." Also, experiments performed during the last few years by large steel companies would indicate that $\frac{1}{18000}$ is a safer value to use for "k" than the $\frac{1}{25000}$ suggested by Merriman.

Thus a very excellent formula for the determination of the safe working stress to be used in the design of mild steel columns is

$$p = \frac{12000}{1 + \frac{1}{18000} \cdot \frac{l^2}{r^2}}$$

Where p=the safe working stress depending on the value of $\frac{l}{r}$.

l=greatest unsupported length in inches.

r=least radius of gyration.

It should be clearly understood that in all probability each new design or problem requires a different permissible working stress. Only when $\frac{l}{r}$ remains constant does the stress remain constant.

The ordinary method of procedure for design of steel columns is as follows: Being given the value of "l" in inches and the load "p" choose, as a first trial, a section that you think will be suitable. Determine the value of its "a" and its least "r." Introduce into the above equation (23) the values for "l" and "r" and solve for "p." Multiply the value of the unit stress "p" by the area of the chosen section to ascertain the capacity of the section at the allowable unit stress. If the capacity of the section is approximately equal to the load but not less in any case, then the section chosen will satisfy the conditions. Should it be noted that the capacity is less than the load, then a new section will have to be chosen, as a second trial. The calculations will have to be repeated. The radius of gyration will in all probability be different so that a new permissible stress will govern in this second trial. The calculations may have to be repeated again, if necessary, until a suitable and economical section is found.

Example 2.—A steel I-beam with properly designed and rigid end connections is used as a short column to support a load of 25 tons. The total length of the column is 9 feet and it is unsupported in any way over its entire length. Determine the proper section of column for this case.

l=9 ft.=108 ins.

Choose a 10 in. I at 25 lbs. as a first trial.

From the handbook we find its area to be 7.37 sq. ins., its least "r" to be .97.

$$p = \frac{12000}{1 + \frac{1}{18000} \times \left(\frac{108}{.97}\right)^2}$$
$$= 7120$$

The permissible safe working stress under the given conditions is 7120 lbs. per sq. in. Then the column is capable of withstanding safely a total stress of 7120 x 7.37 or 52,474 lbs., which is a trifle greater than the load of 50,000 lbs. In this case, our first choice provides a column that is strong enough and without much excess of strength so as to be economical.

This point should be noted, in this connection, that an I-beam is not the best design for a column. An ideal column has equal radii of gyration, that is, its radius of gyration about an axis through its centre of gravity parallel to one side is equal to its radius of gyration through the same point parallel to the other side. The I-beam selected to satisfy the conditions of the problem just solved has a radius of gyration about an axis through the centre of gravity parallel to the flange of 4.07 ins. Whereas the radius of gyration about an axis through the same point but parallel to the web is .97, being less than one-quarter of the former value. For the above problem $\frac{l}{r}$ in the first case is 26 and for the second 111. The permissible stress in the first case is 11,570 and in the second 7120 as seen above.

The designer of built-up columns always tries to have the radius of gyration the same in either direction so that the column may have the same strength in both directions.

A designer who has occasion to work out numerous column designs usually provides himself with a table showing values of "p" for various values of $\frac{l}{r}$. For illustrative purposes, an abbreviation of such a table is given on page 44. See table three for these values.

The results tabulated in table 13 are given in the form of a graph or diagram in Fig. 15. In the diagram permissible unit stresses are plotted against horizontal values of the slenderness ratio. This diagram gives the information at a glance and shows very clearly the variation in stress for a variation in $\frac{l}{r}$.

After Rankine's equation has been plotted as shown, it is possible to approximate the curve by a straight line which may coincide fairly closely with the curve. The straight line diagram given in Fig. 15 does not coincide as

closely as some others that might have been chosen. The one given, whose equation is $p=16000=70\ \frac{l}{r}$ is the column formula adopted by the American Railway Engineering and Maintenance of Way Association.

There are many other column formulae, whose equations are given in the handbooks. Some of these are Euler's, Gordon's, Ritter's, Johnston's parabola formula and Johnston's straight line formula.

The only practical way to study these formulae and see their individual merits is to plot them for a wide range of slenderness ratios and all on one sheet of cross-sectional paper. Do this for each kind of end restraint. A sample of this is given in Fig. 16. In this figure it is apparent that there is not much difference between any two formulae. The writer believes that Rankine's is about the best one and is really the one that was used by every inventor of a new formula in checking up his new one.

In another lesson the writer will work out problems on design involving the use of the beam and the column theories. Additional interest will be added insofar as it will be first necessary to decide in each case which theory applies.

IMPORTANT NOTE

In Mr. Rutledge's article of November 17th some typographical errors occurred. On page 38, in the second column, and 7 lines from the bottom, the expression should read z^2's (or better) the quantities z^2.

In the third column 14 lines from the top the arithmetical calculation should read $r = \sqrt{12} = 3.46$ ins.

On page 39, second column and the second line, the algebraic expression should read $Sc = P \div A$, and at the 10th line of the same column it should read $S \div c = M \div I$.

On page 44, the 4th line should read $\frac{S}{c} = \frac{M}{I} = \frac{E}{R}$

In the last column, 6 lines from the bottom, after $K\ \frac{l^2}{c}$ the words "after substitution in the above formula" should be inserted.

NEW USE FOR COMPRESSED AIR

A concern manufacturing ball bearings gives in a shop window in London an interesting demonstration of the elimination of friction. Compressed Air Magazine, which tells the story, says that an ordinary electric fan is placed in close proximity to two four-bladed fans staggered one behind the other. On the spindle of the latter a little pulley is fixed, from which a belt is taken to a large pulley wheel on an overhead shaft, about three inches diameter, running entirely in ball bearings with several other large pulleys, and from two of these a belt is connected with more machinery on the ground driving a bevel gear, this in turn driving a circular group of large ball bearings. The working of all this series is done entirely by the pressure of air. The electric fan produces a current of air which impinges on the blades of the second fan and keeps the whole train in motion at a good speed. The belts used to drive this combination are made of ordinary cotton tape and thin string.

A Study in Concrete

NEW YORK can rightfully claim to have the tallest concrete building in the world. The structure stands on a site approximately 75 feet square and is eighteen stories high. From the basement to the top of the roof the building measures 223 feet high. Work was begun in October, 1920, and finished early in 1921. To guard against freezing, the concrete was delivered into the molds steaming hot, and the molds were kept sufficiently warm by means of special heaters. As one floor was molded every week, care had to be taken to avoid excessive strains in the green concrete, and five successively completed floors were kept shored during the greater part of the time. The exterior surfaces of the building consist of white Portland cement and colored aggregates, including quartz, felspar and green stone chips, the lowest stories being finished by bush hammering and the sixteen upper stories by the aid of an electrically driven carborundum grinding machine. The general effect of the surface treatment is said to be excellent.

Table 13 — Permissible Unit Stresses for Mild Steel Columns in accordance with formula

$$p = \frac{12000}{1 + \frac{1}{18000}\left(\frac{l}{r}\right)^2}$$

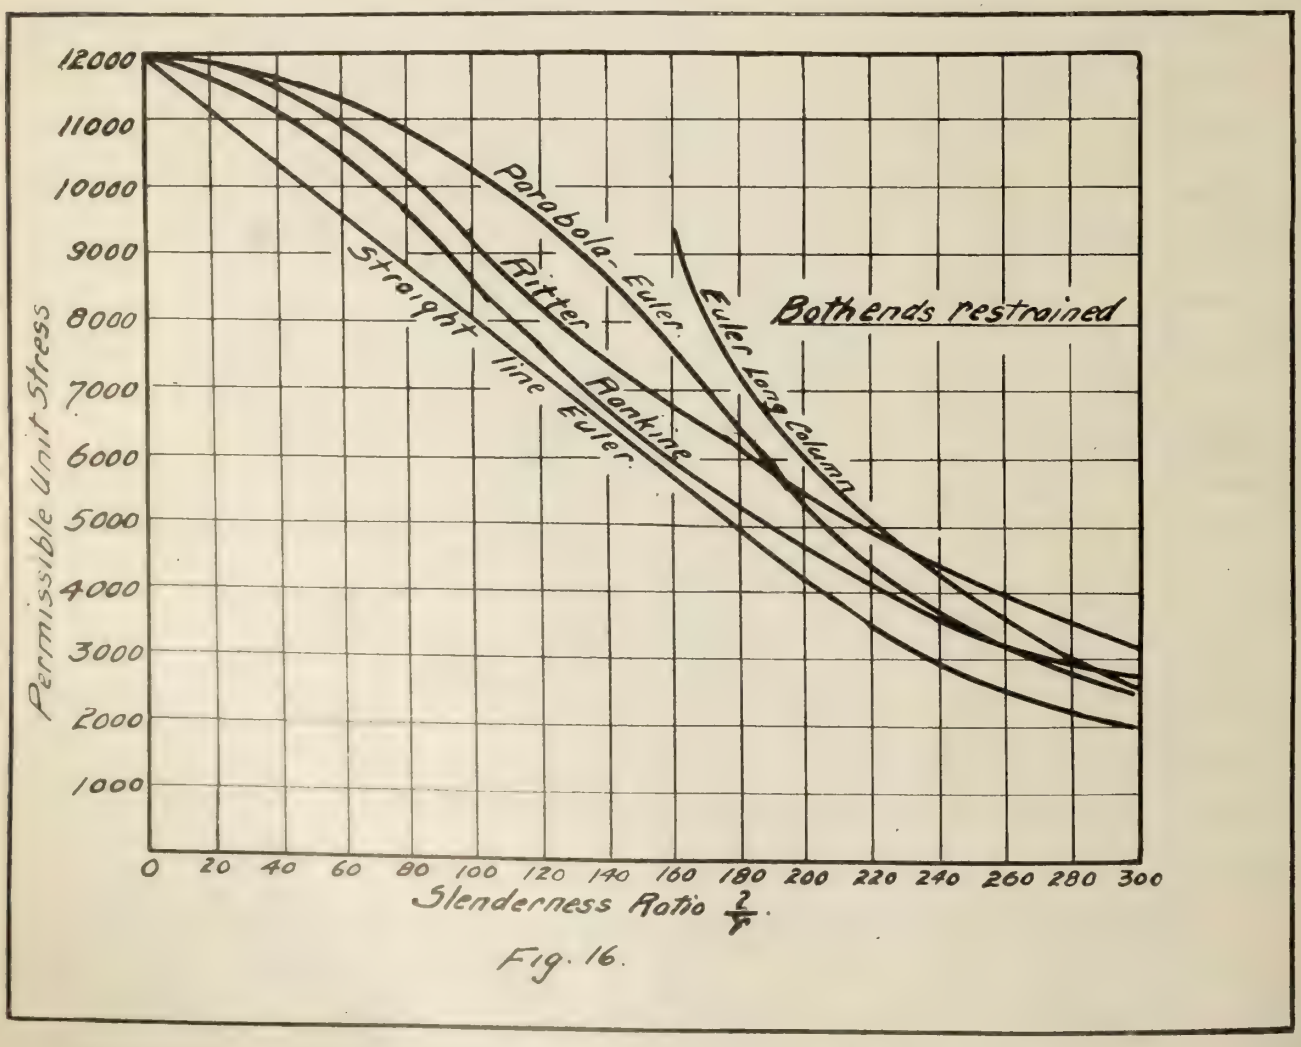

Fig. 16.

WELDING AND CUTTING

Learning To Weld—Some Points For Beginners

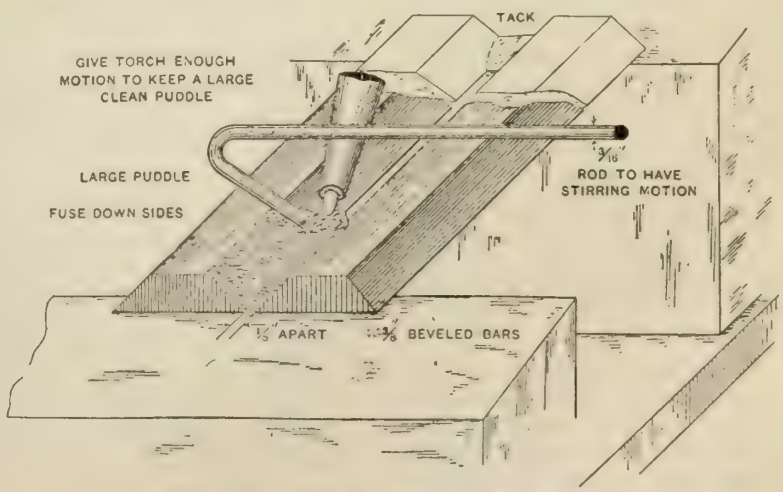
Treatment Must Be Varied, Depending Upon Material, if Best Results Are to Be Obtained—Tool Steel Welding—Steel Melting Range Table—Critical Temperature of Iron and Steel, Etc.

IN THE previous matter discussed, the principles of welding practice have been taken up which apply in general to all metal welding but inasmuch as the characteristics of cast iron, wrought iron, steel, aluminum, brass, copper, monel and other commercial metals and alloys differ widely it is necessary to vary the treatment and methods to secure the best results.

Common sheet and structural steels made by the Bessemer and open-hearth processes are readily welded with the oxy-acetylene torch. The carbon content is generally low, ranging from 0.10 or less to 0.25 per cent. (from about one part to two-and-one-half parts in a thousand). These grades of steel 1-8 inch or thinner may be welded without preparation or the use of welding rods. The joint will be somewhat thinner than the adjacent metal, however, and if the same thickness is required a 1-16 inch welding wire should be used to fill the joint. Steel much thicker than 1-8 inch may be beveled or chamfered to form a vee of about 90 degrees in the joint. Welding rod must be used with all prepared joints to fill the groove.

A principle to be observed in all welding applies to steel when using welding rod, which is, never add welding rod until the edges of the metal to be welded are fused, and a puddle of molten metal lies in the vee. Another principle to be observed in all welding is never to direct the flame upon the welding rod to melt it. The flame should be directed against the joint to form a puddle of molten metal and the welding rod should be melted by the heat of the puddle and the radiation from the flame. If the welding rod is held directly beneath the torch flame two evils may result, the first being oxidization of the welding metal and the second adhesion. The weld metal will be plastered onto the comparatively cold metal beneath which, not having been properly fused, will not cohere. By always forming a puddle in the joint vee and adding to it from the welding rod, using the heat of the puddle to melt the rod, the welder is reasonably sure of securing penetration and cohesion.

When welding thin gauge steel without beveling, the weld should be started at the right and proceed toward the left (for right-hand operators). The flame envelope preheats the metal in front of the weld, and there is less danger of overheating the thin metal than if welding proceeded from left to right. Moreover, greater speed will result.



When welding prepared joints in metal 1-4 inch or more in thickness the welder should start at the left and proceed to the right. The reason for the difference in the direction of welding is that more heat is absorbed by radiation to the cold metal adjacent the weld and it is necessary to apply the flame in the way that will concentrate the white bulb or cone most effectively. When welding a prepared joint from left to right the torch head is held at a slight angle in the direction of the joint, and this naturally throws the flame squarely against the declivity of the material filling the joint.

In no case should the flame be held in one spot until a foam is produced as this is an indication that the steel is being oxidized or burned. Foaming is evidence of improper torch manipulation or that too large a tip is being used for the thickness of the metal.

The welding rod held in the left hand is applied by dipping the end in the puddle. It is general practice to bend the rods to a right angle five or six inches from the end as it is then more convenient for the operator to hold the rod than if left straight. Bending the rod is done quickly by simply playing the torch glame on the rod for a moment and then jamming the end against anything solid to bend it around.

The use of flux on low carbon steel is not necessary. The oxides melt at temperatures close to those required to melt steel, and float on top of the molten metal where they usually give little or no trouble in the joint provided a proper fusing temperature is constantly maintained in the zone of welding.

When welding thin metal strips it is necessary to provide for expansion and contraction stresses in order to avoid

Welding Beveled Joint using Bent Welding Rod.

*From a book entitled Welding and Cutting, published by the Davis-Bournonville Co., Jersey City, N.J.

distortion. The heat tends to throw the edges apart and out of parallel in the opposite way. Unless provision is made to counteract this action the welder will have trouble on long seams as the contraction of the cooling weld will cause the edges in advance of the weld to overlap and make it impossible to proceed. The rule is to set the edges out of parallel about 1-4 to 1-2 inch to the foot. When welding long seams in tanks it is customary to use a separating piece, usually a wedge, or steel piece, shaped like the letter H. The dimensions of the separator depend upon the size and thickness welded. The piece should be set between the edges, and kept in advance of the weld from six inches to a foot or more.

When welding a crack in the middle of a heavy steel plate prepare for welding by chamfering the metal at an angle of 45 degrees to within 1-8 inch of the bottom. Pre-heat the plate beyond the crack at each end until it expands sufficiently to open the crack, an amount that will depend somewhat on the thickness of the plate, usually about 1-32 inch. Then proceed to make the weld and having made it, cover the plate with asbestos sheet and let cool down uniformly.

If the attempt were made to weld a crack in the middle of the plate without preheating, the edges of the plate would buckle under the welding torch or the crack would be extended beyond its original limits. Even if buckling or expansion stresses were not so severe as to interfere with welding the weld would be under severe tensile stress when finished and likely to break in service.

The welder should learn to judge the quality of steel presented to him for welding and be governed accordingly in the selection of welding rod. As previously stated, the common steels of commerce contain low percentages of carbon and are easily welded. But machine steel and some steel castings may contain in excess of 0.25 carbon in which case there may be trouble in welding when using the grade of welding rod recommended for low carbon steel. A test of steel that can be readily made in the machine shop is to apply a piece to the emery wheel and note the sparks. Low grade steels throw comparatively few sparks when ground but the high carbon content steels spark excessively, the sparks exploding in mid-air with characteristic formation which once seen will not be forgotten. High carbon steels up to say 0.50 per cent. carbon including steel castings, steel rails and other track metal may be welded successfully with nickel welding rods.

Tool Steel Welding

Tool steel welding may be accomplished with nickel steel or vanadium steel welding rods but in general the welding of tool steel is not recommended for tool purposes unless it be simply to attach a tool steel bit to a low carbon steel shank or holder. A welded joint in tool steel is generally worthless for cutting purposes as the nature of the weld is necessarily quite different from the tool steel. In other words, it will not harden well and hold a cutting edge satisfactorily.

Alloy steels such as are used in the construction of motor cars, motor trucks and other high-grade machinery may be successfully welded with vanadium steel rods; unless the joint is subsequently heat-treated such work should be avoided, however. No welder who knows his business would weld a motor car axle and put it into service without appropriate heat treatment. While he might be able to make a perfect weld the job no doubt would fail in service because the metal in the weld and that adjacent no longer have the high physical properties which enable the axle as a whole to long withstand the shocks of road service. A welded motor car part is allowable only when it has gone through heat treatment which restores the part to the physical condition of the new part when leaving the factory.

Steel Melting Range Table

The Bureau of Standards, Washington, D. C., has made melting point determinations upon commercial low and high carbon steels with the following results. The melting range of the steels with the high carbon content is not well defined and the results given are accurate within 10 degrees C, or 18 degrees F. for the upper and lower limits.

Melting Points of Steel Oxides

The melting points of the oxides of these steels should be practically the same as the melting point of the oxide formed from pure iron. The composition of iron oxide varies from mixtures rich in FeO and poor in Fe_2O_3 to those rich in Fe_2O_3 and poor in FeO. The oxide produced by heating a steel bar in air is composed largely in Fe_3O_4. The melting point of this oxide is about 2800 degrees F.

Black Oxide	FeO	1419C.	2586F.
Red Oxide	Fe_2O_3	1548C.	2818F.
Black Oxide	Fe_3O_4	1538C.	2800F.

Critical Temperature of Iron and Steel

Mild steel used for boiler plates is seriously injured if worked at a so-called black heat which roughly has a temperature range of 650 to 800 degrees F. This range of temperature is known as the critical range, and steel should not be bent, rolled, punched or worked in any manner while within these temperature limits. The metal must either be cooled to a lower temperature or raised to a higher temperature if damage would be avoided. The critical range of pure iron is higher, ranging from about 1475 to 1830 F. Inasmuch as welded joints are composed of nearly pure iron the welder should avoid bending or otherwise working an oxy-acetylene welded joint at a temperature above cherry red and below a lemon in the heat color scale. If a mild steel plate with welded joint must be worked hot it should be heated to a medium cherry or full cherry red or to a much higher temperature like yellow. On account of the difficulty of judging temperatures from colors and the unevenness of heat distribution in a plate it is generally better to work welded mild steel cold if the conditions and means available will permit.

Welding Shafts

A broken shaft is prepared for welding by beveling the ends, chisel fashion, to an included angle of about 90 degrees, leaving the ends blunt in order that the parts may be accurately lined up. They should be held in veeblocks and adjusted for height and lateral position as closely as possible.

When starting to weld, the broken ends are fused together, breaking down the beveled parts above to fill in. When

How to Make Use of Logarithms

The First of a Series of Articles Showing How to Learn the Use of This Method of Shortening Long Calculations. It Will be Continued in Consecutive Issues.

By T H. Fenner

NOW that the Ontario Board of Stationary Engineers allows the use of logarithms in making calculations, there are many engineers who would like to avail themselves of the help that logarithms afford. In making calculations involving long multiplication sums, the work is very much shortened, and a much greater degree of accuracy made probable, owing to the lessening of the liability of error in handling large quantities of figures.

A logarithm, usually called by the abbreviation log, is really a power to which a certain fixed number must be raised in order to produce the number required. The fixed number is known as the base, and may be any number at all, but in the system in general use, known as common logarithms, the base is 10. That is, to obtain any number at all, the base of 10 must be raised to a certain power, which may be a whole number and a fraction, or simply a fraction. Before studying the subject of logarithms, it would be well to study a little the theory of indices, which will enable the student to better comprehend the system on which logarithms are calculated.

Supposing we have a number which is to be raised to the power of two, or in other words squared. That is, the number is to be multiplied by itself. If we set this down in the ordinary way, it will appear, supposing the number is 2, as 2 x 2, which is 4. Now the first power of 2 is 2, and the second power of 2 is 4. Thus we may say that 2 to the first power, multiplied by 2 to the first power, is 4. Now suppose we take a letter instead of a number, and say a is to be multiplied by a. The product will be a^2. Now, how do we get the second power? We get it by adding together the index figures of the power of the multiplier and multiplicand. Although we do not put in the index figure, which is 1, we imagine it is there, and our sum would appear as:

$$\begin{array}{r} a^1 \\ a^1 \\ \hline a^2 \end{array}$$

Now, if we have, instead of a x a, we have $a^2 \times a^2$ the result would be a^4. Thus we should have $a^1 \times a^1 \times a^1 \times a^1$ which would give a result of a^4. Now if we have $a^2 \times a^3$ the result would be a^5 and if we have $a^2 \times a^4$ we should have a^6.

For instance, the first case would be a x a x a x a, and the second case would be a x a x a x a x a x a. Now let us substitute instead of letters, figures. Suppose we have 2 x 2, the result will not be 4, but 2. The sum would be

$$(2 \times 2) \times (2 \times 2 \times 2)$$
$$= 4 \times 8$$
$$= 32$$

Now, if we multiplied the figures and added the indexes, we would get $2^2 \times 2^3 = 4^5$ which would be entirely wrong. However, we see that if we wanted the power to which the number two would have to be raised to give 32, it would be 2^5.

This leads to the rule, that when a literary quantity, that is a letter, is multiplied with another letter, the indexes must be added together to give the index of the quotient. Now if you have a quantity like $2a^2$ multiplied by $2a^2$, the answer would be $4a^4$. That is the index of the letters would be added together, but the numbers would be multiplied in the ordinary way. Supposing now that the quantity was enclosed in a bracket, thus (2a), with the index outside the bracket, then this would mean that the whole quantity in the bracket would have to be raised to the 2nd power, and the answer would be 4a. Now if we had two of these quantities enclosed in brackets with the multiplication sign between them thus, (2a) x (2a) the answer would be 4a 4a.

This is arrived at as follows:—Take the first bracket, we have as a result $4a^2$, and this has to be multiplied by $4a^2$. 4 x 4 is 16, and $a^2 \times a^2$ is a^4, and the sum would appear in detail like this

$$(2 \times 2 \times a \times a) \times (2 \times 2 \times a \times a)$$
$$(4 \times a^2) \times (4 \times a^2)$$
$$16 \times a^4$$

and as 16 to 4^2 the answer would be 4^2a^4. Now if we were to take the figure 2 as the base of a series of logarithms from which we could determine any number by merely raising it to certain powers, we would find that these powers would be largely fractional. Thus if 2^2 were 4, and 2^3 were 8, then 2^4 would be 16. Now suppose we wished to find a number that lay between 8 and 16, it is evident that the power to which we would have to raise 2 would be a power lying somewhere between the 3rd power and the 4th power. The power required would be 3 and some fraction. Now if we were to denote our base 2 by a letter, say a, then to get the number required we should have to multiply the letter a by itself, and add the index of its first power plus a certain fraction together to get the number required. Thus if we wanted the third power of a, we should have $a^2 \times a$ which would give us a^3, and if we wanted the fourth power of a we should have $a^2 \times a^2$. If we want a power between the third and fourth power we should have to multiply a x a, each raised to a power of one and a fraction. Thus if we wanted a number corresponding to the 3½ power of two, we should have $a^{1.75} \times a^{1.75}$, which would give $a^{3.5}$ and the base raised to this power would be the number required. Now the common system of logarithms is a series of powers to which the fixed number or base must be raised to give any number required, only the base on which these powers are calculated is 10, and not 2 as we have stated. As the base is a fixed number, in the tables of logarithms it is not given, all that is given being the index of the power corresponding to the number. Now we have seen that when we multiply we are adding together the indices, it follows that if we know the indices corresponding to any number, and want to multiply, all we have to do is to add the indices of the two numbers together, and we shall get an index corresponding to a number which will be the product of these two numbers. Similarly, if we wish to divide, we shall have to subtract these two indices, to get an index which will be the index of the quotient of these two numbers. That is the theory on which the logarithmic table is based.

Base of Common Logs

Now the base that is used for the common system of logarithms is 10. The logarithm of 1, no matter what system is used will be nothing, for it is quite evident there can be no two indexes which added together would give an index corresponding to 1. If the base of the logarithm is 10, the logarithm of 10 will be 1, that is the index of the power to which it would have to be raised to give itself would be 1 or 10 x 1. Now the logarithms of all numbers between 1 and 10 must be fractional quantities, for the log of 1 is nothing, and the log of 10 is 1. The log of any number between 10 and 100 will be 1 and a fraction, because the log of 100 is 2, that is the power that 10 must be raised to in order to give 100 as the second power. Between 100 and 1000 the log of any number will be 2 and a fraction, because the power to which 10 must be raised in order to give 1000 is three, thus 10 x 10 x 10=1000. So we get for each multiple of 10 an increase of 1 in the index figure, that is in the integral number, not in the fraction. That varies with each number. We can now proceed to define a little closer just what a logarithm consists of.

Characteristic and Mantissa

We have said that every logarithm consists of either a fraction or a whole number and a fraction, or a whole number. The integral part, or the whole number of a logarithm, is called the characteristic of the log, while the fractional part is called the mantissa. Thus the log of 10 would consist of a characteristic, while the mantissa would be .0000000. The log of 1 would be .0000000, while the log of 100 would be 2.0000000. It is usual to carry the fig-

ures of the mantissae to seven places of decimals, in the interests of accuracy, but in many tables they are carried only to four places. From what has gone previously, it will be seen that there is a very simple rule by which the characteristic of the log of any number can be determined. The characteristic will always be one less than the number of figures in the number whose log is required, or in the number of figures into the left of the decimal point where there is a decimal fraction as well as a whole number.

When the number whose log is required is between 1 and 10, there will be no characteristic, the log consisting of a mantissa only. When the number whose log is required is a decimal number, then the characteristic will be a negative quantity. Thus the log of 20 is

1.30103

the log of 2 is

.30103

and the log of .2

$\bar{1}$.30103

The minus sign is written above the characteristic instead of preceding it as is usual in the ordinary way.

When the figure immediately following the decimal point in the number whose logarithm is required, that is of course a fractional number, such as .02, the characteristic of the logarithm will be —2 and the log would be written

$\bar{2}$.30103

and the log of .002 would be

$\bar{3}$.30103

and so on, every cipher following the decimal point adding one to the characteristic of the log, which is always a negative quantity.

In the ordinary tables of logs, the characteristic is not given, the mantissa alone being shown, and the decimal point omitted. This simplifies the table, and there is no chance of going astray on the right characteristic, if the rule is clearly remembered. That is the characteristic of the log of a whole number and fraction, or a whole number is always one less than the number of figures to the left of the decimal point in the number, and the characteristic of the log of a fractional quantity is always a minus quantity, beginning at minus 1 when an integral figure follows the decimal point, and adding one for each cipher that follows the decimal point, and adding one for each cipher that follows the decimal point before an integral figure is reached.

We will follow up this article with further ones in which examples of the working of logarithms are given, and the method of reading the table shown. If every engineer was aware of the help it would be to him to be able to calculate by this method, he would devote a little energy to learning it. A little practice is all that is required to enable any man to become quite familiar with the method, and further more there are some calculations that cannot be made very well without the use of logarithms. Take for instance the formula for finding the mean absolute pressure when the initial pressure, initial volume and final volume are known, which is as follows:

$$Pm = p^1 \frac{1 + \log_e R}{R}$$

where Pm = Mean abs Pressure

p^1 = Initial abs Pressure

m R = Ratio of expansion ($v_2 \div v$)

(To be continued)

UNIQUE ELECTRIC TRAVELING CRANE

When the first electric traveling crane was built, the builder in all probability did not realize the tremendous possibilities that were opened up for a material-handling appliance of this nature as a labor saving device, and the economical advantages which were to be gained by its use. The diversity of applications of the electric traveling crane and the variety of materials which it will handle to advantage are too numerous to mention here.

One unique application may be seen at the Power Plant of the Union Gas and Electric Company at Cincinnati, Ohio. This crane which was built by the Whiting Corporation, Harvey, Ill. according to specifications issued by Sargent and Lundy of Chicago, who were the Engineers on this work, served as a dredge for an intake well of river water for cooling turbo-generator condensers.

Water is supplied from the Ohio River to the intake well through tunnels and is first cleared of water-logged debris and silt by means of a heavy bar iron grill before reaching the traveling screens behind. This debris and silt is removed from the bottom of the well by means of a grab bucket operated by the crane, and deposited into a hopper. This grab bucket is often called upon to remove heavy water-logged objects such as tree trunks, and it may incidentally be mentioned that on one occasion it brought up a dead cow, very much bloated, from the bottom of the well.

The shape of the intake well is that of a sector of a circle. The crane spans the well radially, having one end truck pivoted at the center of the circle (rotating on a roller bearing at this point), its other end truck traveling on a circular track at the outside edge of the well. This truck is fastened directly to the floor at this level, and a pipe railing is provided around the crane and the operating mechanism of the traveling screens as a safety measure. The crane trolley with its suspended bucket travels along the entire length of the crane bridge or as far in towards the center of the circle as efficient operation of the bucket will permit. The operator's cab is fastened to this trolley extending above the top of the bridge girders and in such a manner as to give the operator an unobstructed view of the bucket and well.

The span of the crane is 49 ft. 10 in., and the trolley is designed for a lift of 100 ft. of the grab bucket which is of ¾ cu. yd. capacity. Two motors of 7½ H. P. each operate the bridge and trolley travel respectively, and two 45 H. P. motors operate the bucket hoist, each one of these motors being equipped with an electric brake.

NEW FORMULA

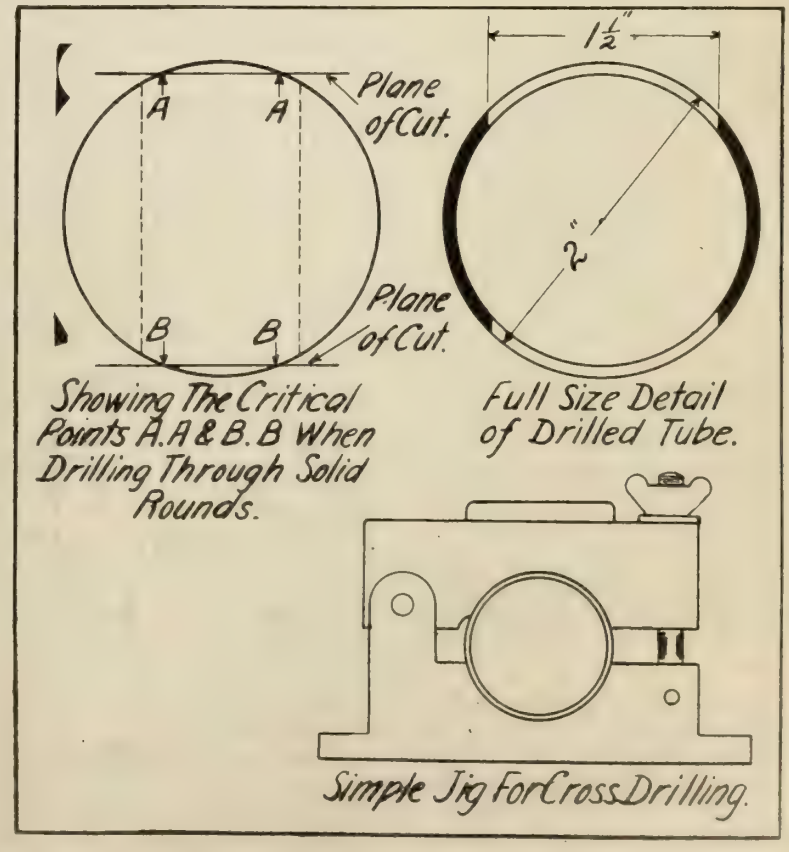
The Du Pont Company has developed and perfected a formula for the manufacture of straight dynamite which results in that explosive being proof against freezing even in zero temperatures. As a consequence of this development, they have determined to discontinue the manufacture of their former straight dynamite and hereafter all this kind of explosive will be made by the new low-freezing method.

Combined Electric Crane and Dredge.

WHAT OUR READERS THINK AND DO

DRILLING CROSS HOLES IN TUBING

By DONALD A. HAMPSON



Everyone familiar with shop practices knows what a mean sort of job it is to drill holes through round bars at right angles to the axis. Starting the drill point on the crown of the piece, intermittent cutting until the drill gets in to full diameter, and (worst) breaking out at the under side with another intermittent cut with the curve of the work nearly approaching the angle of the drill—these are the features of difficulty and they increase as the diameter of the drill nears that of the round bar. End play in the drill spindle greatly aggravates the troubles. On manufacturing work, the use of jigs and the general better physical condition of the machine tool help to some extent but they do not alter the conditions resulting from drilling on and off the rounded surface.

Bearing the above facts in mind, one can readily picture the troubles in store for anyone who has to drill through tubing. Added to the peculiarities of the solid bar, we have those due to two cuts through the inside wall, one of which—the upper cut, entering the concave surface—is the most vexatious of all. The thin wall of the tube, the drill point angle, the drill twist angle, and the nature of the cut (on and off both an inside and an outside inclined face in less than half a revolution) all conspire to try the mettle of drill, machine, and workman.

Manufacturers of beds, hospital furniture, and similar equipment have some drilling problems of their own. The materials used are of low grade, well adapted for the class of work but hard to machine. The angles and other shapes used are of re-rolled stock, generally old rails worked over. The tubing used is often re-rolled from defective plates and is fire-welded along a longitudinal seam the same as pipe is made, though without the same care, as the finished piece does not have to stand any water test and surface imperfections are later hidden beneath coats of white enamel. The tubing arrives on the floor with all the scale intact.

This grade of material is best machined by press work. Of course punches are susceptible to impurities and hard spots but not to the extent of ordinary cutting tools. A drill, in passing through part of an old rail, will encounter hard spots that would not phase a punch and die; and the same is true of the tubing. And there is a large amount of drilling that has to be done in such plants in getting out small orders, samples, and experimental work.

One of those sample jobs involved the drilling of several hundred 1½ in. holes through 2in. tubing of 12 gage. Put up to drill makers to supply proper tools for the job, they all insisted that an end mill was the only tool that would work successfully. The plant didn't possess a milling machine and the kind of work a milling machine does in the average drill press is well known. While waiting for further advices, the engineer did some experimenting to such an end that no tools outside of regular equipment were needed. A jig was made from two castings as shown. This was bolted to the table of a 20 inch upright drill and various forms of tools tried, guiding them through a hard steel bushing. An 1½ inch carbon steel drill was ground with various cutting and clearance rake angles, the best of which proved to be an included angle at the point of 155 degrees with very little clearance and with a rake left just as the spiral of the twist. This almost flat pointed drill was run at a speed of 45 H. P. M. A stream of lubricant was supplied. It was necessary to change the belt drive so that the speed given could be obtained through the back gears because more power was required than could be realized through the open belt. Clean, round holes were obtained in this manner without injury to the tubing and at a satisfactory production rate. The workman turned out 115 holes in a ten hour day on this job, working by the hour, and this included the handling of tubes in eight foot sections.

Showing Detail of Jig Used for Drilling Steel Tubing.

DEVELOPMENTS IN SHOP EQUIPMENT

SMALL ELECTRIC GRINDER

Forbes and Myers of Worcester Mass., have put on the market a small electric grinder head adapted to either bench or pedestal mounting. Model No. 42 is driven by a ¼ h.p. motor and is equipped with two 6" by ½" wheels. Model No. 62 is driven by a ½ h.p. motor and is equipped with two 6" by 1" wheels. The grinding wheels are mounted at each end of the motor housing. Straight, round, or bevel faced wheels can be used.

HARDNESS TESTING MACHINE

Riehle Bros. Testing Machine Co. of Philadelphia, Pa., have designed and developed a hardness testing machine which is a combination of the Brinell and scleroscope methods. It was designed primarily for the use of the Association of manufacturers of chilled car wheels who were making a study of the hardness and comparative wearing and breaking qualities of chilled wheels. The machine enables both the Brinell and the scleroscope tests to be made on the same spot.

HIGH SPEED GRINDER

The Onsrud Machine Works Inc., of Chicago, Ill., have produced a high speed grinder operated by compressed air at a pressure of from 70 to 100 pounds. The complete unit weighs only 5½ pounds and is intended for small grinding wheels. Provision is made for attaching the unit to standard machine tools. It, of course, can be held in the hand and operated as a portable grinder

SPRING TOOL HOLDER

The Willard Tool Co., Inc., of Stratford, Conn., have designed and offer for sale a spring tool holder of the gooseneck type made of drop forged steel and hardened to a spring temper. This holder is made in several types and sizes and is so designed that the tool will yield or recede in a practically straight line from the work, without causing chatter marks or breakage when taking a heavy cut.

VARIED PURPOSE MACHINE

The Sawyer-Weber Tool Manufacturing Co., of Los Angeles, Cal., have placed on the market a machine for performing several varied operations on connecting rods. The frame of the machine consists of a face plate on which may be located clamps, V-blocks, boring tools and other equipment such as is required in babbitting connecting rods, straightening the rod, and boring the bearing to size.

SMALL WORK BENCH

A rather small work bench designed for use in garages and by mechanics in their homes has been placed on the market by Pollard Bros., 4034-4036 N. Tripp Ave., Chicago, Ill. The top is made of selected Norway pine. The legs are one and one-quarter inch angle iron. Each pair is joined by three cross braces welded together. The legs are punched and arranged so that they can be bolted to the floor. There are two stringers of three-inch flat steel bars bolted to the legs which is said to eliminate side or end sway. A large drawer is provided, twenty-three and one-half inches wide, fifteen and one-half inches front to back, five inches deep. The top of the table is thirty-three inches above the floor, forty-four inches long and sixteen inches wide. A semi-steel machinist's vise with three-inch jaws opening four inches, is mounted on the bench. The weight is sixty-five pounds.

PORTABLE CYLINDER REBORING MACHINE

The Bridgeport Cutter Works of Bridgeport, Conn. have recently completed a portable cylinder refinishing machine for reboring and refinishing cylinders of automotive vehicles. It is electrically driven from any lighting circuit. The machine consists of a sliding head on a guiding way that is mounted on top of a cylinder block by means of suitable brackets. Special provisions are made for the locating of the guiding way over the centre line of the cylinders, and also for the locating of the head over the centre of the cylinder to be refinished.

The boring bar is driven at slow speed through reduction gearing. A geared power feed of 1/32" per revolution is provided. However the power feed can be released and a hand feed can be used when required.

The cutters used are of the herringbone staggered type. There are two distinct cutters on the arbor. These cutters both have spiral flutes. The lower cutter, being the rougher, has a right hand spiral so that it will bite into the glazed surface likely to occur in the bore. The upper cutter is the finisher and has a left hand spiral, the teeth of the two cutters being staggered. The finishing cutter is slightly larger in diameter than the rougher and acts as a guide or pilot for it. Cutters can be finished for practically any make of car and in standard oversizes of ten, fifteen, and twenty one-thousandths. The sizes vary from 2¾" to 4". Larger cutters, as they become worn, can be ground down to smaller sizes.

Cylinders with removable heads can often be refinished without removing from the car it is stated. But in the case of cylinders with solid heads, the block must be removed from the car. The makers claim that straight holes, true to size, are possible and that the cost of upkeep is small. The finish is said to compare very favorably with that of grinding.

BALANCING MACHINE

The Precision Balancing Machine Co., of Minneapolis, Minn., have developed a highly scientific balancing machine of the precision type. The machine, it is claimed, applies the principle of dynamic and static balancing invented by B. L. Newkirk. It enables complete static and dynamic balance to be obtained by two single corrections, individually measured and located near the ends of the body. The determinations, it is claimed, can be correctly made by operators, irrespective of their skill, and with great speed, the machine thus lending itself to interchangeable work manufactured on a production basis.

A spring mounted and pivoted frame carries a special type of headstock, and adjustable rollers to support the work. By the form and location of the springs a free vertical vibration of the free right hand end of the frame may take place about the pivot springs as a fulcrum point. All revolving parts of the machine are mounted on roller bearings. A speed of rotation above the "critical speed" of the frame is first used, the driving power is then disengaged, permitting the gradual reduction in speed down to and through the critical speed" of the frame. At the point of critical speed there occurs the maximum vibration and it is proportional to correction required in the overhanging end of the work, irrespective of any unbalance having a resultant in the place of the pivots. From an observation on the dial indicator mounted on the column at the left the amount of the required correction is determined.

A disc carries a standardized 10 oz. weight which is adjustable radially by means of a vernier to .01 of an inch. This disc is exactly balanced when the weight is at zero. The disc is adjustable to any angle, with reference to a protractor dial, which engages the other revloving parts by means of a jaw clutch. This permits adjustments to be made without first bringing the work to rest. With a correction thus made the system is again speeded up and allowed to pass through the critical speed as before. The second amplitude bears a relation to the first amplitude dependent on the angle between the point of ap-

plication and the point required. After determining and setting of the angle a third run will check the result. For determining the corrections proportionate to amplitudes, taking ratios, and ascertaining angles a special calculating rule requiring but two settings is installed at the top of the instrument column.

After completing the first determination, the work is reversed in position and the correction determined for the plan initially over the pivots, thus completing the operation. As critical speeds of from 100 to 110 r.p.m. are said to give the best results the machine can be manipulated by hand or by an electric motor. The low speeds used permit visual observations of the amplitudes and prevent distortion of the work from centrifugal forces.

The machine is adapted to a wide variety of work including the balancing of automotive crankshafts, flywheels and all parts readily mounted on arbors. It can take care of pieces up to 24" swing and take 32" between bearings and is sensitive enough to give extremely accurate results on small and light work.

NEW STEEL FOR DRILLS

A new form of steel has been developed by the Cleveland Twist Drill Co., Cleveland, Ohio. This steel is to be used in the manufacture of their drills, and such drills are to be known under the trade name of "Mezzo." Speaking on the new steel, the Cleveland Co. say that it possesses some very unusual qualities, and that these are the result of a special heat treatment. The word "Mezzo" is intended to convey the meaning, midway between carbon and high speed steel. Drills made from this material are said to be well adapted for drilling cast iron at greater speeds and feeds than can be used for carbon drills. They will also speed up work on machine steels and the softer alloy steels, but are not recommended for use in extremely hard materials. These drills should be operated at approximately double the speed of carbon drills. They are not intended to supersede high speed drills, but rather to furnish a type midway between the two extremes.

SPIRAL BEVEL GEAR PLANES

A true spiral bevel gear planer has been developed by Messrs. Smith & Coventry, Ltd., Gresley Iron Works, Manchester, England. This gear planer has been so constructed that the time of setting up has been reduced to a minimum. The adjustments are few and simple, and in practice is said to take no more time than the set up of an ordinary gear planer. The spiral adjustments are taken care of by gear trains, in a way very similar to that employed on a screw cutting lathe. Thus the spiral on gear and pinions must agree. The true spiral gear always causes less end thrust than a spiral of arbitrary curvature. The gears of arbitrary spiral curvature present some difficulties in the machining which are not present in the S. & C. gear planer method of producing true spiral gears, and it is claimed that the machine can be set up to profitably cut one pair of gears. The machine belt is driven through a three step cone. It is known as No. 16, will cut spiral bevels up to a limiting blank diameter of 17", and will cut up to a ratio of 6 to 1. It will produce teeth having spiral angles up to 35 degrees, which is sufficient to cover the full pitch of wheels whose face is twice the circular pitch at the large end. It deals with gears up to 3" face. The three step belt cone connects to the cutter slides by an improved "quick-return" mechanism, specially designed to give a slowing down towards the end of the cutting stroke, in order to reduce the "breaking out" which occurs at high speed cutting, especially in cast iron blanks.

A grinding attachment is supplied with the machine and can be fitted to any cutter grinder taking a cupped wheel. With this attachment the grinding of cutters is made easy. A simple system of gauges for setting the tools is supplied with the machine. Twenty-one dividing plates are supplied, dividing all numbers up to 50 and many others up to 120, and also full set of change gears for dealing with all the numbers covered by the dividing plates. Spanners, charts, and operating instructions form part of the regular equipment.

TRACK TORPEDO

The old type of track torpedo which has served its very useful purpose for many years, has been officially superseded by a torpedo of radically new design, on all lines of the Canadian Pacific Railway. This new type is called the "Meteor." A more reliable method of attaching this torpedo to the tracks, than the soft metal bands, is used. It is fastened by means of two spring rail clips made of tempered steel or spring brass, this gripping the rail head firmly, and at the same time being promptly applied. Furthermore, assurance has been made trebly sure. The new torpedo appeals to three senses instead of one, not only hearing, but seeing and smelling. It not only produces a loud report on detonation, but simultaneously a brillant flash and pungent smell.

It is completely waterproof, will stand any atmospheric conditions of heat, moisture and frost. It has been subjected to one hundred hours immersion, and one hour in moist steam at 120 deg. Fahrt. without deterioration, and has been used where the temperature was many degrees below zero with complete success. Special tests have been carried out to ascert in its holding power when placed in position on the rail, and for flying particles likely to cause injury to bystanders. These have all been carried out with satisfactory results.

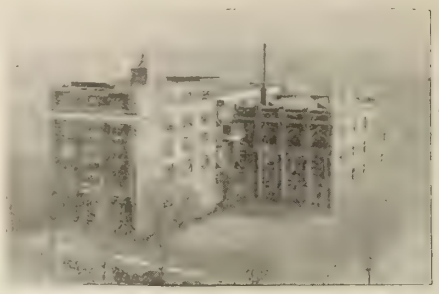
SELF-SETTING CLAMP

Chas. P. Archibald & Co., Montreal, have secured the agency for an English made self-setting lathe or planer clamp or dog. It is known to the trade as the AUTO-SET. This clamp is made from a steel forging and when used as a clamp can be instantly adjusted to any height range within the limits of its capacity. All surfaces are ground and the clamp comes fitted with a bolt. The bolt has a specially designed head and fits into a specially ground seat which allows all set-ups to be made without any angularity of the bolt. It may be mentioned that the clamp requires nothing in the form of a block when used. It is claimed that it is entirely free from slipping. Its strength is guaranteed, and it is guaranteed against breakage if the bolt supplied is used. It is made in seven sizes ranging in capacity for clamping work varying in thickness between three-eighths of an inch and two and three-quarter inches. Special sizes are made to special order.

DOUBLE SPINDLE GRINDER

The Chas. H. Bisley Co., Chicago, have recently placed on the market a direct-motor-driven double spindle ring wheel grinding machine. The machine is equipped with two 7½-horsepower alternating-current motors of a fully enclosed type. A push-button control is provided for stopping and starting the motors, the starters being attached directly to the motor frames. The motors are mounted on plates which slide on vees planed on top of the bed. This arrangement permits the motors to be moved longitudinally to accommodate different widths of work, the movements being accomplished by means of racks and pinions.

The principle of operation is of course to grind simultaneously both sides of a part parallel, either by dry or wet grinding and the machine can be equipped with different types of rests. A direct-connected motor-driven pump is attached to a leg of the machine directly under the water pan. The starting apparatus of this pump is also controlled by a push-button. The pressed-steel chucks with which the machine is equipped are intended for ring wheels 18 inches in diameter, with faces ranging from 1½ to 4½ inches in width, but 20-inch diameter disk wheels may also be used. The maximum distance between the ring wheels is 10 inches, and the height from the floor to the center of the spindles, 39 inches.



E. J. Codd Co., Baltimore, MD., have issued a small booklet which describes the Wiegand patent chain screen door as used for furnaces and ovens. The method of usage together with details of construction is given.

There Is Always a Way Out

CANADIAN manufacturers are as resourceful as those of any other country. During the present depression in business many firms have branched out into new lines; products previously unthought of have been made, with the result that shops which otherwise would have been idle have been kept running.

Here is a case in point. A certain firm had been engaged in shipbuilding during the boom years. Modern machinery was installed, an up-to-date foundry was started, and a first class boiler shop put into operation. Some 1400 men were employed during the busy period. At the close of the war the demand for ships suddenly ceased, and the management were confronted with the problem of keeping the plant in operation.

After a short period of inaction, it was decided that some other lines of manufacture should be taken up. Expert engineers were sent throughout Canada and the United States expressly for the purpose of discovering good lines to handle. A conference was then held, and it was decided to manufacture three new lines: (1) A machine used extensively in mining operations—(2) certain lines of improved pulp mill machinery, and—(3) a line of heating boilers. Thus, foundry, machine shop, and boiler shop were provided with work. Each line has proved a decided success.

We do not suggest that every manufacturer faced with a shut down can adopt exactly the same course, but we do believe that in many cases a careful study of conditions would bring to light side lines, which if manufactured, would keep the plant in operation until normal times returned. The chief danger to avoid is the choice of some product that requires special tools and fixtures. Keep your existing equipment in mind when considering a new line. Ask yourself the pertinent question "Can I make this new product at a profit without tying up too much money in special tools?" If the answer to your own question is satisfactory, and you feel there is a market for the article after you make it, then you will have provided a "resourcefulness" tablet for another niche in the Canadian Manufacturer's Hall of Fame.

A Good Idea

There is a regulation affecting motor or horse drawn vehicles, that a red flag must be displayed at the back of any load that extends over the truck itself. Usually an old piece of bag or a dirty rag is tied on carelessly to the protruding load. This is very poor policy, and is not following the true meaning of the regulation.

The other morning a load of structural steel on a large motor truck moved down the street. Dangling from the rear end was a neatly painted board about 6 in. by 8 in. This was painted a brilliant red and was attached in a business like manner with a stout piece of wire. The arrangement allowed the danger sign to swing with the truck and it was constantly in motion. Here is an idea, that while not exactly new, is not used as often as it should be. Manufacturers should see that their shippers are supplied with such a sign, and that whenever a load extends over the edge of truck, that the sign be used. The word DANGER should be largely displayed. Thus both the public and manufacturer will be protected, for a pedestrian injured by a load not properly flagged could make it hot for the manufacturer who owned the truck.

MARKET DEVELOPMENTS

Steel Production Keeps Up With October Rate

Production of Steel Is Around Forty-Five Per Cent. Mark—Pipe Mills Show Highest Production Figures—Steel Market Prospects Brighter—Pig Iron Dull, Also Machine Tools

ALTHOUGH some people would have you believe the steel market has gone to the bow-wows, production figures give such a statement the lie. The present rate of steel production is approximately 45 per cent., this being one per cent. over the October rate, which was the highest since last February.

At the beginning of October, sheet mills showed the highest operating rate, but now the pipe mills hold top position with a rate of about 70 per cent. Tin mills are running at between 60 to 65 per cent., and while the operations at bar, shape, plate and rail mills are decidedly light, they have improved a trifle in the past few weeks.

Blue annealed sheets are selling at $2.25; black at $3.00, and galvanized at $4.00. Prospects are that these prices will hold. Prices on standard steel pipe and oil country goods are maintained by the steel corporation pipe subsidiary, but are being cut a trifle by nearly all the independents.

Steel market prospects generally are distinctly better than three or four weeks ago, and from present outlook it is unlikely that any material drop will occur in production this winter. This means that the Spring improvement will start at a correspondingly higher level. Pig iron continues dull, and coke prices are softer again.

Both Montreal and Toronto report business as dull. Outside of a very light activity in some lines, there is nothing of importance to mention. The only bright spot, so far as Montreal is concerned, is the order to build an ice-breaker for the Canadian Government.

Machine tools and the small tool market are also quiet. Montreal says that small tools are selling best of these two lines, but in Toronto's case, neither shows any decided activity.

STEEL PRODUCTION ABOUT THE SAME AS IN OCTOBER, 45 PER CENT.

PITTSBURGH, December 1st.—Despite the allegedly dull steel market in the past six weeks production is fully up to the rate in October, and of course the production is entirely against orders since the mills would not think of stocking any steel. It is a matter of comment in the trade now that there is quite a divergence between the tales that are told of the market being "dull" and the circumstantial evidence of the actual production. One point that helps to explain is that a few weeks ago, when mills were making a drive to fill up so that they could advance their prices, there was some business placed for delivery to the end of the year, and the mills are making shipment of such tonnage now while the buying does not count as present day business.

Rate of Production

The Steel Corporation has been operating at between 50 and 55 per cent in the past three weeks. Some independents are running at approximately this rate, while rates in other cases range down to 40 per cent.. and as for many months past a number of small independents are closed entirely. All told, the steel industry seems to be operating at fully 45 per cent of capacity, or within a couple of points either way of that figure. October showed an average operation of 44 per cent, the highest rate since last February.

At the beginning of October sheet mills showed the highest operating rate among finishing departments, wire mills and pipe mills coming next and being approximately on a level with each other. Since then sheet mill operations have fallen off very considerably while wire mill operations have fallen off a trifle, pipe mill operations have greatly increased, so that the pipe mills are well in the lead of other finishing branches. There has been consistent improvement in demand both for standard pipe and for oil country goods generally, while there has been very fair buying of line pipe. The pipe mills are operating at an average rate of 70 per cent or higher, while sheet mill operations fall somewhat below 70 per cent. and wire production is lighter still. Tin mills are running at between 60 and 65 per cent. Operations at bar, shape, plate and rail mills are decidedly light, but on the whole have improved a trifle in the past few weeks.

Last Friday the American Sheet & Tin Plate Company (Steel Corporation) opened its books for first quarter business in sheets, prices being 2.25c for blue annealed sheets, 3.00c for black sheets and 4.00c for galvanized sheets. Prospects are that these prices will hold and the market be stabilized. If the independents cut the prices the Steel Corporation wil experiment with lower and lower prices until it finds a schedule the independents do not cut. A week before the announcement was made that books were open for first quarter business some independents were quoting black sheets at 2.75c, possibly less in a few instances, and galvanized at 3.75c, but the extreme prices were withdrawn, presumably in fear that the corporation would name them for first quarter. The black and galvanized sheet prices are those reached by the advance in September, but the blue annealed is the old price, ruling prior to the September advance, which did not hold. It is needless to remark that the advance attempted in October by some independents, to 2.75c for blue annealed, 3.25c for black and 4.25c for galvanized, turned out a joke. If an advance of a reasonable amount had been attempted there is a bare possibility it would have succeeded.

Prices on standard steel pipe and oil country goods are maintained by Steel Corporation pipe subsidiary and are being cut a trifle by nearly all the independents, though perhaps no more deeply than a few weeks ago. The differ-

ence is not enough to draw trade away from the corporation. In line pipe the cutting is very deep, below the regular cost of production, but the mills taking business at the extreme prices probably count upon the increased operation reducing their costs in the aggregate, and thus making up in that manner.

Bars, shapes and plates are a shade easier each week, though there are no regularly quotable declines. There is merely a gradual softening. It at one time a certain price applies on a given tonnage a little while later a buyer can get the same price on a smaller tonnage, and so on. Plates can easily be bought at 1.50c, though it is not certain but that a trifle more would have to be paid for a car load. Bars generally go at 1.60c to 1.65c on carloads, while especially desirable orders bring out a price of 1.50c or thereabouts. Structural shapes show a wide range of prices according to tonnage, etc., the average being 1.55c or 1.60c.

A few more freight cars have been bought. Including orders noted in last report, the buying in the past three weeks now totals about 7,000 freight cars, with enquiries going the rounds for 13,000 cars and with 8,000 cars reported as about to come into the market.

Prospects Are Better

Steel market prospects, at long range view, are distinctly better than three or four weeks ago. At that time it was expected that demand and production would fall off during the remainder of the year, and while an improvement was counted upon for the early part of the new year, the improvement would have to start from a lower foundation. Now the outlook is improved in that there is unlikely to be any material drop in production in the winter, and the spring improvement will start at a correspondingly higher level.

Seeing that the steel market is quite unlikely to lose ground to any extent, and that there are no unfavorable developments, recent or in prospect, favorable influences only are to be considered. These are:

(1) Gradual improvement now occurring in business generally.

(2) Continued easier condition in money, with interest rates falling.

(3) Gradual decline in the commodities that have remained at fancy prices, steel prices having long ago reached a very moderate level.

(4) Improvement in the financial condition of the railroads, deficiencies under the expected earnings return being now quite small.

Thus the steel industry is likely to come up to February 1 with a good foundation, ready for development of the increased consumptive demand that normally comes with the approach of spring. There is a distinct possibility that in addition to consumptive demand there will be demand for partial restoration of stocks, which all steel buyers have reduced to the extreme. By March steel mills operations to 70 or 75 per cent. while if there is any stocking of consequence the rate may get up still higher for a time. By advancing prices at such a time the mills could encourage the stocking, having a full operation for a while and then a long period of liquidation again.

Pig iron continues very dull, with prices, generally speaking, not overly firm. The valley market remains at $20 for Bessemer, $19 for basic and $20.50 for foundry.

Connellsville coke is softer again. Spot furnace is down to a range of $3.00 to $3.10, depending on tonnage and brand. Spot foundry coke is $4.00 to $4.50, the reduced range quoted a week ago, and as rather soft at those prices, there being scarcely any demand.

POINTS IN WEEK'S MARKETING NOTES

The steel corporation have been running at between 50 to 55 per cent, during the past three weeks. while independents range from this rate, down to 40 per cent. All told the steel industry can be said to be running at about 45 per cent.

Pipe mills are now well in advance of other finishing branches, the rate of production being around the 70 per cent. mark. Operations at bar, shape, plate and rail mills are decidedly light, but on the whole have improved a trifle in the past few weeks.

Pittsburgh reports that blue annealed sheets are $2.25; black sheets, $3.00, and galvanized sheets $4.00. Prospects are that these prices will be held.

A few more freight cars have been bought, this bringing the total up to about 7,000. Enquiries are going the rounds for 13,000 more.

Pig iron remains very dull, with prices none too firm. Connellsville coke is softer again, and spot furnace is down to $3.00 to $3.10 depending on tonnage and brand. Spot foundry coke is $4.00 to $4.50.

A new ice breaker has been ordered by the Government, and the Canadian Vickers, Ltd., Montreal, have received the contract. The cost will be around $1,580,000.

Montreal reports a quiet market in all lines. Bars are moving, but slowly, pig iron prices have not altered, and machine tools are not in great demand. Small tools are selling at a fair rate. This field is the only bright spot on the market.

Toronto duplicates the above report. Apart from sheets, which are in fair demand, there is nothing of interest to report. Even small tools show a decline in demand this week.

NOT MUCH TRADE IN LOCAL CIRCLES

TORONTO, December 1st.—Compared with last week's activities, the market locally, cannot be said to shine. Things are not dead by any means, but on the other hand orders are not piling up on the desks. If orders were coming in bulk sufficient to cause a heap on the desk, dealers generally would be a happier lot. As one man expressed: "It's the funniest market I've ever bumped up against. Just when you feel you're out of the woods you get a set back. You work up prospects to a certain point; you feel they are ready to buy; they as much as say so, and then—cold feet set's in, and your spirits drop in like fashion."

The above statement covers the situation like a blanket. Every dealer has a list of prospects that would satisfy, if they would only become buyers and not merely prospects. "Time and again," said another dealer, "I have had (here he mentioned a certain firm) ready to buy. Instead of closing however, they take time to think it over, the result being no business. They decide to wait until better times." This timidity seems to be the real obstacle. Some think that after election, this state of affairs will change and business open up, which is a consummation devoutly to be hoped.

The steel market is still featureless. A certain amount of business is being closed, but nothing of importance. Sheets are the strongest of all lines, but this is to be expected. Prices remain the same and with the cold weather settling in, structural steel is lessening in demand.

Non-Ferrous Metals

Non-ferrous metals have taken on a firmer tone this week, thanks to the New York market. In fact there is more active interest shown than has been the case for some time past. Prices have not changed and dealers who have any stocks at all seem quite content to hold fast, refusing to purchase further material except at very low figures. The scrap market generally is more active, but nothing to boast about. Stocks must be getting pretty low throughout the country, and dealers are looking forward to a change for the better before many months have passed. Such an improvement wil be gradual but will be welcome nevertheless.

Machine Tools

The demand for machine tools is conspicuous by its absence. What little demand exists seems to be among the smaller manufacturers, who unfortunately have not much money behind them. Have you ever heard of buying a machine tool on the same plan as you would a phonograph or a piano? If not, listen to this one.

A gentleman sauntered into a dealer's during the past week and said he was in the market for a certain class of machine tool. He was shown something that suited him, said so, and asked if he

could have terms. "What terms would you like," asked the dealer, and back came an off-hand reply to the effect that 20% down and $100.00 a month would suit him, if the dealer could see it that way. The dealer pointed out how long it would take the man to pay off the tool at such terms, how he could not afford to carry him for such a period, etc., etc., but without success. "It was that or nothing" challenged the prospective buyer, and needless to mention, it was "nothing."

An important question which one dealer discussed with Canadian Machinery this week, was that of the proposed new "Machinery Hall" for the Toronto Exhibition. "We are very anxious to get in on this," said the dealer, "but the ten year clause puts us outside entirely. We cannot afford to sign any such obligation, as our principals are not in favor of any such move. To my mind," continued our informant, "a better proposition would be to have a two year guarantee clause. This would not tie anyone up too long, and by that time the exhibition authorities would see what a wonderful need they had satisfied, and would no doubt wish to embody other clauses to cover the situation thoroughly. We need a building of this nature. No one will deny, or even dispute that fact, but it is hardly fair to shut out, through a long period clause, dealers like myself who are anxious to get in, but cannot sign up for ten years."

This viewpoint is worthy of consideration. One thing sure, we must have a building, but on the other hand, if it is to be truly representative, no one anxious to show their wares should be discouraged. Surely there is some way in which the exhibition authorities can cope with this ten year clause. There is no reason why the new machinery hall cannot be a credit to the exhibition, and there is only one way to make it so, viz., encourage everybody to come in on the proposition. The dealer who has spoken so plainly on the matter, would take a good sized space, exhibit machines under power, and in every way add to the attractiveness of the display as a whole.

We hope that by the date of erection, some satisfactory solution will have been arrived at. Of course there is always this ray of hope. If sufficient manufacturers sign up for a ten year period to warrant the erection of a new hall, the building would be made large enough to accommodate more than the original backers, and no doubt others could get in on a yearly rental scheme.

If this is so, then the objections as stated above would be automatically wiped out.

The small tool field reports a slight easing off in demand this week, and one dealer thinks manufacturers are so busy giving their wives money for Christmas presents that they have forgotten the small tool merchant altogether. Seriously speaking, the outlook this week is not so good, and dealers do not look for any decided improvement until after the Christmas season.

New Ice Breaker to be Built; Machine Tools Are Still Quiet

MONTREAL, December 1st.—This week has seen the placing of another large contract with a local firm. The Hon. C. C. Ballantyne announced on the evening of the 24th, that the lowest tender for the proposed new Government ice breaker was that of the Canadian Vickers, Ltd., and that the contract would be awarded that firm shortly. It will be remembered that an ice breaker was constructed for the Government in 1914 but owing to the conditions existing at the time, it was sold to the Russian Government. It has ben felt that a new ice breaker would be constructed at an early date to replace the original one. Figures on the ice breaker were obtained some eighteen months ago and it was found that it could not be constructed at a reasonable cost. The lowest bid at that time was in excess of 2,000,000. The recent bid of the Canadian Vickers firm is $1,580,000, at which figure the contract will be placed. By waiting the year and a half it has been able to place the contract for a sum of $700.000 less than the tenders received early in 1920. The contract has been let at a most opportune time as there is a great deal of unemployment in the class of labor that will be employed on the ice-breaker. The breaker will be employed on the St. Lawrence and through its operations it is thought that considerable time can be added to the length of the navigation season. The contracts that have recently been placed for work of various natures in the engineering field has done a great deal to restore plants to their usual activity. The steel for the new Mount Royal Hotel has been delivered and is being rapidly passed into the Dominion Bridge Co. shops. It is announced that the erection of steel will be started on Dec. 15th. The sale of steel, sheets, bars and pig iron seems to be about as active as has been usual for the last few weeks. Generally, the whole steel and iron business is in a very satisfactory condition when all things are considered. The placing of the large orders has given consumers and shop men a great deal more confidence in the markets and will have a good influence in starting 1922 off at a good pace.

For the past few weeks there has been very little change in the volume of business. From some quarters a slight gain is reported, while in a few instances a slight decrease is reported. On the whole there is probably a net gain. There is a steady demand for a large tonnage of steel in spite of the reports of slack business. In fact the output of steel cord for the year at 72,204 long tons, is an increase of nearly 16,000 long tons over the production during the preceding month and some 200 tons more than the output for August, when the previous high record for the year was made. During the latter part of the month there was a favorable turn in the steel making industry closely following up the increased production across the border.

Business in bars is quiet. There is, however, a slightly better demand for small bars, and cold rolled steel. The demand for cold rolled steel is keeping up better than was expected. A certain amount of building in a small way is going on in nearly every quarter of the city and this coupled with several large buildings going up, really puts the building activity in the city as one of its live industrial factors. The weather this autumn has been ideal for outside work and contractors have taken every advantage of it. Sheets and plates are fairly active. The demand for the last week has fallen off a little after its increased activity just previous to the announcement of the close of navigation.

Very little of interest has taken place in the pig iron market in the last week. Prices have not altered and the demand continues to be about the same. Statistics show that in October the production of pig rose to the August level which was somewhat above the September total. The decrease in freight rates on the first of the month may be the forerunner of a slight shaving of the price, but as present quotations are not much above the production costs it is felt that the producers will be somewhat tardy in making a further cut. The foundries have not come into the market to any noticeable extent. The recent placing of several contracts for the repairing of cars, the ice breaker and several other activities, should create a demand for castings. It is confidently expected that there will be a decided increase in the volume of foundry work offering, within the next two months.

Machine Tools

Very little has occurred during the last week to change the position of the machine tool market. The announced price reductions on several internationally known tools does not seem to have stimulated their sale to any marked extent in Canada, at least not locally. It is pretty well acknowledged that price does not often sell a machine tool if there is a legitimate demand for it. The railways have not given the indication that they will come into the machine tool market. The large volume of motive power and rolling stock that is idle at present will enable railways to

(Continued on page 66)

INDUSTRIAL NEWS

The Arctic Co., Winnipeg, Man., is now erecting an ice plant costing $200,000.

The Sea-Sled Co., Montreal, Que., has been incorporated to build boats, etc., with $1,000,000 capital stock.

The Crystal Dairy Co., Lethbridge, Alta., are building a manufacturing plant costing $100,000. Building will commence early in the New Year.

The erection of a factory is contemplated by the Cyclone Fence Company of Canada, Canada Cartridge Plant, Hamilton, Ont.

The Ontario Hydro Commission will build a Hydro-Electric system for power and lighting for the Yarmouth Township in the province of Nova Scotia. The cost will be about $115,000.

The London and Port Stanley Railway is having plans prepared for installation of additional power units, enlarging terminals and construction of additional siding. The cost will be about $100,000.

The Cole Mfg. Co., has been incorporated to manufacture wood and metal products, etc., at 40,000 capital stock. The above firm is situated in Lindsay, Ont.

Mongeau & Rubber, Ltd., Montreal, Que. have been incorporated to manufacture iron, steel and copper, brass Iron, steel and other metals, with $99,000 capital stock.

Lubri-Gaitors, Ltd., Montreal, Que., has been incorporated to engage in business as iron founders with $100,000 capital stock.

The Civic Works Committee of the City of Toronto, has approved of the Bloor Street widening project, involving an expenditure of $1,250,000, of which $937,500, or 75%, of the cost is to be paid by the tax-payers.

The C. N. R. Railway board announces a reduction of 10 per cent. in freight rates, this reduction also extends to Pullman and sleeping car rates.

Truro, N. S.—Mr. Frank Stanfield of Stanfields' Ltd., reports their mills very busy with the outlook for the winter excellent. The prospects are that to meet the increasing demands their premises will have to be extended.

Rights for the manufacture and sale in Canada of an Electric Vibrating Screen, has been secured by the Engineering Equipment of Montreal, of which James W. Davis, formerly with the Canadian Ingersoll-Rand Co., has become general sales manager.

The Canada Hotel Co. intend erecting a hotel in Quebec City at a probable cost of between $1,500,000 and $2,000,000.

A contract for reinforcing steel for Collegiate costing $700,000 for Ottawa Collegiate Board is placed with Dominion Reinforcing Co., Ottawa, Ont.

Reinforced steel contracts for high school costing $450,000 for the Walkerville Board has been awarded to the Trussed Concrete Steel Company, Walkerville, Ont.

Steel contracts for rink costing $30,000 for Grimsby Arena Limited has been awarded to Hamilton Bridge Co., Limited, Hamilton, Ont.

Ruggles Motor Truck Co., Hamilton, Ont. is again operating on full time. It is expected that the factory will continue on the present schedule.

There is a possibility that work may start on the construction of a $500,000 building at London, Ont., early in December.

Col. Gideon Miller, Salvation Army architect, Toronto, says that contracts for the construction of the $15,000 addition to the Grace Hospital, Windsor, Ont., will be let shortly.

Repairs are being made to the Manitoba Government telephone building in Winnipeg, Manitoba. The total amount expended will be around $110,000.

The following firms have been incorporated with Dominion charters Molybdenite Reduction Co., $2,0,000; Consolidated Bullion Hydraulic Mining Co., Vancouver, $5,000,000;

The Dominion Incinerator Co., with head office at Montreal, capital $250,000, to carry on the business of building and engineering, specializing in construction of incinerator plants and other public works. This is one of the recent trade incorporations.

Expenditures on roads in the province of British Columbia for the past six years have been on an average of $3,264,301 per year. For a period of three years ending May 31, 1921 over 1207 miles of pavement has been completed in this one province alone.

The L. R. Steel Development Corporation of Canada will immediately start work on the construction of a three storey building in Brantford. The work of wrecking the old buildings already on the site has been let to the Sullivan Construction Co.

A general reduction of 10 per cent. in freight rates on all steam roads under the jurisdiction of the Board of Railway Commission will go into effect December 1st.

The Columbus Rubber Co. of Montreal, Winnipeg Branch, are moving from their present location to larger premises in the Stobart, corner of King Street and McDermott Avenue, shortly after the first of the new year.

W. H. Banfield & Sons, Toronto, are finding a rapidly increasing demand for metal stamping and special machine work as well as for their standard lines of phonograph motors. electrical fixtures and supplies.

A Cotton mill that will employ 200 or more will be established in Welland, Ont. P. T. Granthan former manager of the Empire Cotton Mills, has the plans in hand. The product of the proposed company will be cotton yarn and other cotton products.

The third enlargement of the plant of the H. H. Crosby Co., Hebron, N. S., within the past few years is just being completed. The additional space and equipment will make possible a daily output of from 8 to 10 hundred pairs of shoes.

The Canadian Export Paper Co., Montreal, Que., announces the completion of reorganization, influential men connected with other paper concerns being in charge. The organization now controls for export purposes approximately 800 tons of newsprint per day. Their prices for the first quarter of 1922 will be $35,00 a ton which is a reduction of $5.00 from current prices.

A new building has been erected to house the steel foundry department of the J. W. Cumming Mfg. C., New Glasgow, N. S. The department has now been in successful operation for six months and the electric steel furnace has a capacity of 3,500 pounds per heat. Miscellaneous castings, etc., are being manufactured.

Mr. L. M. Wood, of Wood, Fleming & Co., Toronto, has prophesied that 5,000 to 6,000 men will be employed within the next two years the automobile industry situated at Leaside, Ontario with the plant of Durant Motor Company. If Mr. Wod's prophecy proves true then the above concern will be considered as the largest industry of its kind in Canada.

During the first eight months of the current year Canada sent some $27,000,000 in gold out of the country, ranking fourth among the list of exporting countries.

Chapmans, Ltd., Kent Building, Toronto, has awarded the contract for the construction of an artificial ice plant. Estimated cost $70,000. Location is not settled as yet.

Fire losses in Canada for a period covering from August 1914 to December 1916, amounted to $52,027,000. The average total fire loss for the past three years was approximately $27,000,000 per annum.

The Monarch Tractors, Brantford, Ont., are planning to reorganize. The name of the new company to be formed will most likely be "The Monarch Tractor Ltd.," or any other such name as may be approved. The company is capitalized at $1,000,000.

Sydney, N. S.—Maurice Murphy, chief mechanical superintendent of the Dominion Coal Co., becomes assistant chief engineer of the British Steel Corporation. A. Stewart succeeds Mr. Murphy, Jas. Pristine becomes round house master mechanic, Rod Livingstone construction foreman, and R. W. Carmichael becomes car shop foreman.

North Sydney.—Shipping is still brisk at North Sydney, many steamers are in for bunker and coal cargoes. The steamer Canadian Ranger after bunkering sailed for Russia with railway equipment. The Canadian Rancher after bunkering sails for United Kingdom with a cargo of pulp.

Halifax, N. S.—Halifax Board of trade and representatives of the Halifax shipping men, after a meeting here telegraphed L. S. Brown, Eastern supt., of the C.N.R. urging for better facilities for handling the greatly increased traffic expected this winter. According to schedules submitted to shipping men there will be 160 sailings to this port this winter, exclusive of Royal Mail Boats and other established lines. In this connection it is hoped that work will be commenced on the south end deep water terminal shed.

Sydney, N. S.—Considerable stir has been caused in Cape Breton coal circles by the announcement that foreign going steamers have been bringing return cargoes of United States coal to St. Lawrence ports, particularly Three Rivers and Montreal, where it is sold at $1.00 per ton below the price of Nova Scotia coal. Several thousand tons of coal were discharged from the freighter Northern Pacific at Three Rivers which was landed at Newport News, and it is understood that shipments of similar nature will continue as long as navigation is possible on the St. Lawrence.

The incorporation of G. B. and H. B. Robinson, Ltd., is gazetted today, with head office at St. John and capital stock of $25,000. The company is authorized to take over the business now being carried on in St. John by Henry B. Robinson under the name and style of G. B. Robinson as insurance agents, and to carry on a general business as insurance agents and brokers. Nicholas J. Thibodeau and John A. Kennale of Bathurst, doing a machine shop and garage business under the name of Thibodeu and Kennale, have dissolved partnership from date of November 9, Mr. Thibodeau retiring. John A. Kennale and Herbert Kennale will continue the business as Kennale and Thibodeau Garage.

London, England.—The International Shipping Conference at its second session yesterday adopted a resolution recommending the Hague rule of 1921 concerning bills of lading for voluntary international application and as far as may be necessary for adoption by an international convention between the maritime countries.

Reversing Falls, N. B.—The new bridge over the Reversing Falls, N. B. has been officially turned over to the C.P.R. for operation by G. A. Mountain, chief engineer of the railway commission. The first passenger train to pass over the bridge being a special of three cars and an engine.

Ryrie Bros. of Toronto, along with Birks & Company, of Montreal, have acquired the Bank of British North American Building at Hamilton, Ontario, which has been owned by the Bank of Montreal for several years. The deal involved between $150,000 and $200,000. Extensive alterations are planned for the present site.

The Advisory Industrial Committee of the Board of Education, Toronto, Ont., at its regular meeting the past week, recommended that the new east end branch of the Technical School Building on Greenwood Avenue, be proceeded with as early as possible, and instructions have been given to apply to the Government for its quota of 50% of the cost of the work.

The Management of the Dominion Match Co., is now being assumed by the E. B. Eddy Co. of Hull, which purchased the factory of that concern at Deseronto, Ont., in July 1920. Changes in the management are now being made. At the present time about 120 people are employed and it is stated that during the past six months business with them has been normal showing a decided increase for the past two months.

The October statement of the Industrial Department of the Harbor Commission reports a decided increase in business optimism, and unless something unforeseen is experienced there is likely to be little unemployment in Ontario in 1922. Fourteen or fifteen firms are considering locating sites owned by the Harbor Board and a number have definitely decided to establish plants in Toronto.

A new rough stock room for handling new material has recently been completed at the works of the Canadian Drawn Steel Co., Hamilton. An overhead electric traveling crane, passing over the C. P. R. tracks at the south, and the G. T. R. tracks at the north gives excellent facilities for quick and economical unloading of raw material. The company also have a very heavy drawing machine on the way but the erection of this has been stopped for a time.

A special meeting of the Public School Board of Kitchener, Ont., have accepted the plans for the remodelling and enlarging of the Sudaby School at an estimated cost of $135,000, work to be begun early in the new year. The building will be about twice the size of the old one.

The establishment of an iron and steel industry in British Columbia is imminent, according to Hon. C. D. Patullo, Minister of Lands, who has stated that a representative of some British interest of thorough reliability was enroute to Victoria to discuss the matter. Proposals were to be submitted to the Government in this regard.

The automobile show in Windsor will be held the week of February 27 to March 4, 1922, at the Armouries, under the auspices of the Border Cities Automotive Dealers' Association. The officers of the association were re-elected for another year on Friday. F. L. Copeland is president; Fred Duck, secretary; A. E. Thompson, treasurer.

The Victoria, B. C. plant of the Cameron Lumber Co. has resumed operations after a shut down of nearly a year. They state that they have orders now on hand that will be sufficient to keep the mill busy for at least a month and they will cut about 500,000 feet of hemlock for Japan as the first contract. With the reopening of the mill 200 men will receive employment.

The Metal Stampings Co., 111 Adelaide St., W., Toronto, are in the market for the following machines: 3 spinning lathes, 28 in. swing, 6 ft. bed; 3 buffing spindles; 2 foot presses with deep throat for riveting; 1 automatic riveting machine with deep throat; 25 to 30 h.p. motor alternating current 550 volt, rotary sheer and 1 double action Toggle press 12 to 16 in. stroke, 30 in. between uprights.

The Winnipeg Top and Trimming Co. are at present erecting a new building in Winnipeg, Manitoba which they expect to occupy very shortly. A new limited liabilty company is being organized with a paid up capital of $20,000 an the stock and good will of the Auto Top and Supply Co., who have been doing business along this line, has been purchased.

The Windsor Machine and Tool Co., a $500,000 concern has launched into the manufacture of automobile pistons. The trade name of the product will be "Wilkie" after Lorne A. Wilkie, president of the company, but the pistons, made of gray iron will be of the same model as a well known American type. Sizes to fit every model of car now on sale in Canada will be supplied and Mr. Wilkie calculates that 500,000 pistons are sold in Canada every year, and that 90% of this number are imported from the United States.

Montreal may have a new hockey arena next year. If it is decided to erect such a structure, operations will commence about April.

The Canada Machinery Corporation are building an 80-inch driving wheel lathe for the Manchurian Government railways.

The Oak Tire & Rubber Co., Oakville, claim that they have over $100,000 of unfilled orders on their books at the present time.

The Stevens Co., Galt, are building two special machines for the Ford Co., Walkerville to be used in connection with Mud-Guard operation.

The Goldie & McCulloch Co., have secured the contract for installing new pumping units in the Georgetown municipal waterworks plant.

The Bishopric Lamp Co., Cin., Ohio will erect a sulphate plant near Dunkirk and has awarded contract for the erection of same. The project included power plant, equipped with steam engines, boilers and generaters, and will cost $100,000.

If present plans of the Bell Telephone Co., go through, a telephone exchange having an estimated cost of nearly a quarter of a million dollars will be erected in the city of Hull. This move is not expected however for a year or so.

There was a total attendance of 20,000 at the Made-in-Galt exposition, and that with only a few days preparation. Given a couple of months advertising a much larger outside attendance will be there at the next event.

The Dominion Tack & Nail Co., are filling an order for Australia for three hundred thousand brass tacks. This plant produces about 650 different kinds of tacks and special nails and consume 500 tons of metal yearly. The demands of the motor car, furniture, boot and shoe, and upholstering industries alone accounts for a large consumption.

Pembroke: W. A. Nichols, who owns a sawmill at Carleton Place has purchased 300 acres of fine pine. When this lumber is cut and they have already started to chop it down, sufficient logs will be secured to keep the above mentioned mill busy for several seasons.

The Herbert Morris Crane & Hoist, Co., with head office and factory at Niagara Falls, Ontario, have found it necessary to open a branch office in Hamilton to take care of its increasing business in that city and surrounding district. Mr. F. C. Simpson is resident engineer in charge of the new branch, which is located at 512 York Street.

With the R. McDougall Co. operating an inexhaustible jug having no visible sources of supply, for its rich brown liquid, and the Hinman Milker producing milk from an invisible cow, the made in-Galt-Exposition was not without an air of mystery. The McDougall pitcher seemed to have the edge in popularity for as one sightseer declared, "Yon milk is o'wer blue to come frae ony coo; but this is aye a bonnie color that Andy has here. Hoo he diss it I dinna ken."

The Carbon Alloy Steel Co., of Niagara Falls, Ontario, is reported to have leased 33,000 acres of land in the neighborhood of Malone and Eldorado for the purpose of mining iron ore. It is said that twelve properties have been leased, nine of which have deposits of hematite iron ore and the other three magnetite. The deposit of ore is said to be very large and if present plans are carried out it will be mined and smelted on a large scale.

"Our business for the year is ahead of 1920 business." An average volume of business is coming in daily and prospects for 1922 are up to normal if not a little better than previous years"—states the American La France Fire Engine Co. of Toronto. The company are completing a new type of hand drawn gasoline engine.

The Laing Mfg. Co., Guelph will build a public garage, 90 ft. by 50 ft., adjoining their machine shop. This concern has been specializing in the production of park and golf benches also machine shop vises. A recent change occurred here whereby J. Skidmore became manager, and R. B. Laing severed his connection. A co-operative plan is adopted, stock being held by the employees.

W. R. Stewart, who has been connected with Jenkin Bros., Montreal, for 21 years has severed his connection with the above mentioned company. He has taken over the agency for the Kerr Engine Co., Walkerville, who are also manufacturers of brass and iron valves, fire hydrants and improved sprinkler equipment. Mr. Stewart has charge of the district east of Hamilton, also the province of Quebec. He is located at 58, Manning Chambers, Toronto,

A demonstration of an improved flax scutching machine was given by representatives of Vickers, Limited of London, England, at H. W. Petrie's, Toronto. A number of flax specialists, including representatives of the Department of Agriculture at Ottawa, have inspected the machine in operation and have passed an opinion on the flax fibre produced. There are approximately 70 flax mills in Ontario. The Vickers representatives are planning on making demonstrations in scutching before American flax men, and if the market situtation warrants they are prepared to manufacture machines in Canada.

The London Concrete Machinery Co. of London, Ontario, have purchased the business of the Ideal Concrete Machinery Co. of Windsor and are moving the entire plant to London. The Ideal line consists of a line of concrete block machines, power tampers and ornamental moulds. The London Concrete Machinery Co., who already have a large business covering concrete mixers, hoists, pumps and other contractors' equipment, are making provision for increasing the output of the Ideal concrete block machines. Their new catalogue covering this line will be issued about December 1st.

Mr. C. C. Laporte, manager of the Montreal branch of the K. & S. Tire and Rubber Goods, Ltd., states that up to date they have increased their 1921 sales one hundred per cent over the 1920 sales. This was accomplished in spite of keen competition, the general business depression, and an average all around reduction in prices of about twenty per cent. The reason that Mr. Laporte assigns for the remarkable showing is that he has a good line of goods and he has honestly pushed their sale day in and day out. "We never let up," he says, "The business is there, but you have to dig it up."

It is reported from Winnipeg that the grain shipments in 1921 over the Canadian National Railway Western Lines increased more than one hundred per cent over those of 1920. Officials stated that 80,000,000 bushels of wheat had been handled between September 1st and November 19th this year.

Automatic lathes for the manufacture of wooden sporting goods have been installed in the factory of the Harold A. Wilken Co., Toronto. They state that the quality and style of these products are first class and that they are able to manufacture at a price 25 per cent. to 30 per cent, lower than imported goods

New equipment installed during 1921 at the plant of the Canadian Roofing Mfg., Windsor, Ontario. will triple its capacity. The entire installation will be ready to operate by the beginning of the new year. A new product produced by the added equipment is the paper asphalt shingle, which the makers state promises to be one of the greatest developments in the roofing industry.

Extensions are under way at the plant of the Thomas Watt Co., Vancouver Machinery is being installed for the manufacture of rivets, bolts, nuts, tacks screws, ship-chandlery, etc. The company also intend to enlarge their galvanizing branch so that they can increase their output and make a speciality of galvanized goods. They expect to build up a export business on the Pacific Coast.

A representative of Canadian Machinery who visited machine manufacturers in Western New York recently, reports much better feeling there than was the case two months ago. Orders are coming in, and wheels are buzzing where for a while they were quiet. There is a tendency to fasten great hopes upon the disarmament conference as a means of stabilizing unsettled European conditions and again making world markets worth while.

Readers of Canadian Machinery will be interested to learn that the affairs of the Garlock-Walker Machinery Co. have now been satisfactorily arranged. From now on, the newly organized company will be known as the Garlock Machinery Ltd., and the assets of the new company will be used to pay off creditors of the old company at 100 cents on the dollar. In other words all accounts will be paid in full. The premises and organization of the former company have been taken over, and business will be carried on, as Mr. Garlock, Jr. puts it, in as thorough a manner as is humanly possible.

The Kerr & Goodwin Machinery Co., Brantford; Ontario, are building up an export trade in Oil Engines. Repeat orders for them have been received from France and shipments have recently been made to the British West Indies and South America. The engines are also in use throughout the Dominion. The engine is a semi-Deisel and is purely an oil burning engine, developing a dependable power, at a great saving in fuel.

The rapid increase in business has caused William Shannon Co., Toronto, to become too crowded and they have prepared plans for a new factory which they expect to occupy next May. The building will cost about $35,000 and contain approximately 22,000 square feet of space. Provision has been made for an additional 15,000 sq. ft. when required. The company will manufacture decorative work, drapery trimmings and cords for fancy work, etc.

The contrast in cost of exhibiting at the Galt Exposition and at the National Exposition in Toronto is striking. The former's charge of $6 for a space of 7 square feet made the show available to the most unpretentious concern, whereas the charges for space in the so-called Machinery Hall at the National are said to be discouraging if not prohibitive to small concerns. The proposition is to build a new Machinery Hall at Toronto on the undertaking of prospective exhibitors to guarantee the rental of certain spaces for 10 years. It is estimated that the building should pay for itself in twenty years. In the meantime the suggestion that there should be a special Galt building at the National Exposition is more than an idle whisper.

"Some depth of satisfaction is sounded by American manufacturers in the straightforward kind of diplomacy that has developed at the disarmament conference in Washington," said W. P. Andrews, of High Speed Hammer Co., Rochester, N.Y., to Canadian Machinery recently: "After all is said and done, blood is thicker than water. Great Britain will win great admiration throughout this country for the enthusiasm she has shown, her willingness to consider and the absolute freedom from prejudice of any kind. No "ante" propaganda can spoil the spirit that is shown and great good is going to result. If they permit Germany to sit in, as has been suggested, surely some way can be found to meet the French requirements, and of course there should also follow a solution of problems affecting China and Japan. The old world is on the brink of great things."

We have received information to the effect that by an act amending the Patent Act, it is possible to file Canadian applications for patents on inventions that have been in public use since August 1st, 1913. Under the original act applications had to be filed within a year of such public use. Owing to the war and conditions arising therefrom, it has been found that many manufacturers have neglected to secure protection from 1914 to the present date and such protection can now be obtained, Our informant also adds that any manufacturer having a working arrangement in regard to patents with an American company, where the American patent has been issued since August 1st, 1914 is now able to secure corresponding protection in Canada. The privilege of filing such applications in either case expires on December 4th.

Newcast'e, N. B.—The town of Newcastle have contracted with New Brunswick hydro power commission for the entire supply of electric power for the town. The power will be supplied by the Bathurst Lumber Coy's development on the Nepisiquite river. They will close down the steam plant and will install Allis Chalmers centrifugal power driven pumps of 600 Imperial gallon capacity for the town water system.

A contract for important additions to the pumping and distilating system of the Montreal water works department has been placed with the Dominion Engineering Works, Montreal, who specialize in the manufacture of hydraulic machinery of large capacity. This company have lately taken up the manufacture of large gate valves and at the present time are building a Johnson hydraulic valve, 20 feet in diameter which is intended for installation at Shawinigan Falls under a head of 140 feet. This is the largest valve of this height yet undertaken.

The Canadian Car and Foundry will finish by the first of December all the track work for delivery this fall to the Toronto Transportation Commission. The company is the only manufacturer of street railway manganese track work in Canada and their sole competition on these orders came from the United States, principally from the United States Steel and Bethlehem Steel Corporation. The business has been claimed in a series of orders, the first one having been placed when the Commission first came into effect about the end of August. To date the business has totalled a half million dollars, and further orders are expected as soon as weather conditions permit further track laying. In addition to the ordinary car tracks the Canadian Car and Foundry have supplied material for 30 intersections on the Toronto jobs, all manufacturing having been done under a Montreal plant at Longue Point, and Pt. St. Charles. The special intersection orders included everything from turn-out's to grand union's. All special pieces are of solid Manganese. The company has been supplying steel to all the principal cities in Canada and presently expects to deliver a number of frogs and switches to the C. T. R. and C. P. R. This firm is also repairing 2,000 freight cars for the C. N. R. at Montreal, Ft. William and Amherst jobs.

BUSINESS BETTER IN UNITED STATES

The First National Bank of Boston notes a distinctly better feeling toward business, not in the sense that business is free, active and profitable—for it is not—but because many, and the most difficult, steps in the business readjustment have already been taken, and persistently, if slowly, the products of the farm are being brought more nearly into balance with retail prices of goods. The downward trend of commodity prices for the moment has been checked, and in fact the average has risen slightly in recent weeks, lumber, copper, cotton, oil, wool, and some steel products contributing to the increase. While building construction awards are increasing and are now in normal proportions, the recovery in steel is being blocked by scant buying on the part of the railroads. The reason is obvious. The railroads' gross earnings for September were $120,000,000, or 20 per cent. less than in September, 1920. Only by cutting down expenses in every way, including paring down maintenance materials, was this enormous shrinkage offset. Heavy buying of steel by the roads under these conditions is out of the question. Transportation charges form so large a part of the final cost of goods that the demand for lower railroad rates, meaning further reduction in railroad wages, is growing more insistent and is being recognized as the barrier to a revival of business. The eleventh-hour rescinding of the railroad strike order was mainly in response to this public demand.

OBITUARY

On Friday November 18th a cable from the south of France announced the death of Sir Frederic Orr-Lewis. He was at his residence, the Villa Viletta, and had been in poor health for some time. Sir Frederic founded the large ship-building plant of Canadian Vickers and at the time of his death was president of the company. He was also president of the firm of Lewis Bros., Hardware merchants in Montreal. In addition he was a director of the Merchants Bank of Canada, of the Bankers' Trust Co., the Montreal Cotton Company, and the Canada Steamships Lines.

Sir Frederick was born in Hamilton, Ontario in 1861, and started his business career in that city and after a few years as apprentice to a hardware merchant, moved to Montreal in 1887 where with two of his brothers established the Lewis Brothers Hardware. He was on board the Lusitania when she was torpedoed and was in the sea several hours. When picked up he was in an exhausted condition. He was ill for a long time afterward and never seemed to fully recover from the effects. Sir Frederic's connection with Candian Vickers, involved a great interest n the parent concern of Vickers in England. Of late years his time was about equally divided between Canada and Europe.

Have You Tried This Contest Yet? If not--- Do so Now

Below will be found twelve references to advertisements in this number. To the sender of the first correct set of answers to these we will forward one of these scales.
To win one is not difficult, and at the same time you will add to your store of knowledge. Read the details given below.

The scale is 6 in. long and is made from finest quality steel. One side is marked in 32nds, the other side in 64ths. A table of decimal equivalents is also stamped on one side, and a table of tap drill sizes on the reverse side. This scale is well worth securing.

What You Have to Do

We publish every week a number of interesting facts or statements selected from the advertising pages for that week. The selections for this issue are given below. Read these through, then turn to the advertising section and see if you can pick out the advertisements to which they refer. The work is interesting, it will train your powers of perception and of memory, it costs you nothing, it will make you better acquainted with the various lines of machinery and tools in the market, and with perseverance you are bound to win one of these useful scales as a prize.

The present contest page will be the last. Starting with next issue, we will have a new form of contest, which will offer still greater inducements for readers to exercise their capabilities. Unfortunately no one submitted a correct list for the Nov. 10th contest. Question No. 6 was the stumbling block. Refer to Page 2 of the Nov. 10th issue for the answer.

CONTEST FOR DECEMBER 1ST ISSUE

Contestants are required to write us, stating to which advertisements we refer in this number.

1—How to save money every day.
2—Something built to handle large or small work.
3—How to simplify the output.
4—Something of which there are a number?
5—A case where you can't say too much.
6—Something that tells you why.
7—A claim that has never been seriously questioned.
8—Something said to be separate yet complete in itself.
9—How to survive the chiseling attack of?
10—Something that is popular.
11—How to save gas and oil.
12—Something that is the result of combined experience.

These are Correct Answers for List from November 10th Issue.

1—John Bertram & Sons Co.
2—Wisconsin Electric Co.
3—Dalton Mfg. Corporation.
4—Canadian Fairbanks Morse Co.
5—Dominion Steel Products.
6—Nicholson File Co.
7—Nova Scotia Steel & Coal Co.
8—Rice Lewis & Son.
9—Carlyle Johnson Machine Co.
10—Canadian National Newspaper & Periodical Association.
11—Fellows Gear Shaper.
12—MacLean Publishing Co.

Closing Date for This Contest is December 22nd.

Right on the Lead

GEOMETRIC

The Threading Machine that makes Quick work of Big Orders
for Small Threaded Parts.

There are three sizes—½-inch, ¾-inch and 1-½-inch

Not the ordinary bolt cutter, these machines duplicate threads rapidly, accurately, profitably, doing work that cannot be handled on the ordinary Screw Machine or produced economically in any other manner.

FOR DOUBLE QUICK THREADING
THE GEOMETRIC DOUBLE SPINDLE THREADING MACHINE

Is a very rapid producer, handling practically as much work as two single machines.

THE GEOMETRIC TOOL COMPANY
NEW HAVEN CONNECTICUT

Canadian Agents:

Williams & Wilson, Ltd., Montreal. The A. R. Williams Machinery Co., Ltd., Toronto, St. John, N.B., Halifax, N.S.

New Machine Developed—Various Features

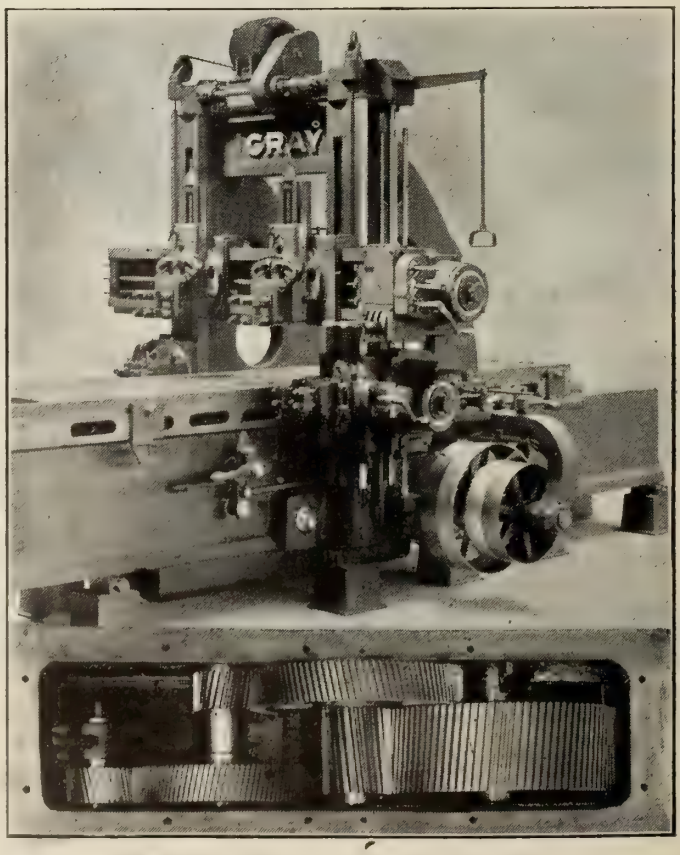
THE G. A. Gray Co., Cincinnati, Ohio, have developed a maximum service planer, some of the chief features being described in the following article. This new machine is equipped with a cantslip feed. As the name implies the feed is positive, and the method of adjusting is by turning a knob at the operator's end of the rail until the required feed is indicated on the graduated dial. A partial turn of the wrist gives any feed from .01" to 1" in steps of one hundredths of an inch. The feed dial is automatically locked as soon as the fingers are removed from the knob. The feed mechanism for the rail heads is mounted on the end of the rail; that for the side head is mounted on the head itself, thus it is always within convenient reach. Rail head and side head feeds are entirely independent so that one can be changed without affecting the other. Feed changes may be made while the planer is running.

Rapid Traverse

The rapid traverse embodied in these planers is applied to the side heads as well as to the rail heads. To move a head the operator simply shifts one lever. Shifting the lever disconnects the feed for that particular head, engages the rapid traverse mechanism and starts the small motor in the proper direction. Moving the lever back to neutral throws out the rapid traverse clutch, stops the motor and reengages the feed. It is not necessary to make use of a separate starter to start the motor, nor does the motor run while not actually in use. No part of the rapid traverse mechanism is in motion unless a head is actually being moved. As the traversing mechanism is entirely separate from the feed mechanism one head can be rapidly set for the next cut while the other head or heads are still feeding. Throwing in the traverse mechanism automatically disconnects the hand cranks so that these do not revolve and endanger the workman. The levers for actuating the rail heads are at the end of the rail. the lever for each side head is on the head itself. Shearing pins safeguard the traverse mechanism in case the rail heads are accidentally jammed together. Safety stops obviate the possibility of lowering the side heads too far.

To elevate the rail the operator pushes up a stirrup hanging near the end of the rail; to lower the rail he pulls it down. The stirrup is locked in the neutral position. A quarter turn of the wrist unlocks it. As this stirrup is suspended from a universal joint, the operator can stand out in front of the rail where he can see the position of work and tools. The motor that operates the rapid traverse also furnishes the power for the rail-setter. One movement engages the elevating mechanism and starts the motor. Bringing the lever to the neutral position disengages the elevating mechanism and stops the motor. Safety stops obviate the possibility of raising the rail too high.

The Rail-Lock



Turning a crank on the operator's end of the rail releases or tightens the clamps that lock the rail to the housings. Automatic adjustment insures that the rail is clamped equally rigidly at both ends. As the lever operating the rail-setter is also on the operator's side of the machine the planer hand can release this rail, raise or lower it and reclamp it without moving away from his operating position.

The net result of these improvements is to bring the control of practically all of the functions of the planer to the operator's usual position. Besides the raising, lowering and clamping of the rail, as described above, he can, without moving from his position, set the feed on rail or the right hand side head; traverse either rail head or the right hand side head quickly by power; set the micrometer collars on the rail screws so as to measure accurately the travel of the tool; and of course, use the tumbler which controls the movement of the table. In doing these things he is in a position to watch his tools and so avoid accidents.

The bed of this new planer is made full length, that is, the working surface of the table never overhangs, even when taking the maximum stroke. In this way the table is always rigidly supported even when run way out to the front end of the planer for setting up work. The table is of box section, with an interrupted center wall running the entire length and tying the top and bottom plates rigidly together. This design prevents endwise springing due to peining action that occurs when heavy work is clamped. The usual traverse walls and posts are also provided. All stop-pin holes open into the cored openings of the table are easily cleaned from the outside.

All driving gears run in a bath of oil so as to minimize wear and prolong their life. An oil pump is direct-connected to the drive shaft and delivers a flood

MONTREAL MARKETS

(Continued from page 55)

keep operating without using all of the available equipment already in their shops. To a great extent the average machine shop is in much the same condition. The small shop man is really the busy man in the machine shop line and he is also the man who is creating quite a percentage of the small demand for machine tools. In many cases this type of customer buys new machines. The turn over of the second hand, or remanufactured machines, still continues. and no doubt will continue, until the surplus of machine tools has disappeared from the market. There has been manifest a very persistent effort on the part of the manufacturer of machine tools to improve his product. Dealers are daily receiving announcements of new features on old machines, and new designs of machine tools. There is no doubt that this activity on the part of the manufacturer will net him a dividend when conditions open up. At present the demand has not been visibly increased.

Machine Shop Supplies

As we have noted from week to week, the small tool and supply business has been the bright spot in the market. The generally normal way of doing business, (as was accepted as good practice before 1914), has been much in evidence in this department, and is to a certain extent responsible, for the volume of business. During the war years the machine shop man was educated on the value of good tools. It is perhaps this experience that has taught him that he must use the best tools to meet competition and still make a profit. There have been no price changes of any moment, although as the demand increases, and the price of raw material and labor comes down, there will naturally be many small reductions from time to time.

Non-Ferrous Metals.

A few price changes of a minor nature are noted in the non-ferrous metals. There has been but little activity in the business moving locally. Business is improving with the Northern Electric Company and they will no doubt be in the market regularly for more or less copper at a date early in the year. Tin, lead, and spelter have been quiet with a few minor price changes. There is a prospect that the market will witness a reasonably large increase in business early in the year. With the elections coming on, followed by the Christmas season, and the generally dull business situation, not a great deal is looked for until the first of the year.

It has been a long while since there was any activity in the scrap metal market, and it appears as if there will be little or no activity until the spring. There are practically no inquiries and hardly enough demand to produce a quotation.

LEARNING TO WELD

Continued from page 45

fusion and union of the ends have been produced the welder proceeds to fill in the vee with adding material to a depth of say one-fourth the diameter. The shaft then is turned over and the same procedure followed on the opposite side, the parent metal at the bottom of the vee being thoroughly fused together before starting to use adding material. Welding on this side should be carried up to about one-fourth the diameter also, and then the shaft turned over and the weld completed on the opposite side. When welding is finished on side No. 2 the contraction stresses will be well equalized and the alignment good.

On motor car repair work it is often advisable to throw away a short shaft section and weld on a new part which then will be machined to size. Time will be saved and a better job produced when the broken end is deformed or badly worn.

Use nickel steel welding rod on nickel steel motor car shafts, and heat treat after welding to refine the metal. The heat treatment should be fixed by the carbon content. If the carbon is in excess of 0.30 per cent., and the nickel is about 3.25 per cent., heat to a full red, quench in cold water bath and reheat to about 800 to 1000 degrees F., and let cool slowly. If the carbon is higher than 0.45 per cent. it may be advisable to quench twice, the second quenching being done at a low red heat. Then reheat for annealing as before.

Steel Castings

Heavy steel castings should be prepared for welding and preheated with all the care given to brittle metals. While steel castings are not so brittle as cast iron it is essential that internal stresses be neutralized in order that the strength of the parts when welded will not be seriously reduced. Moreover, preheating is economical, the amount of gases required being much reduced as compared to the volume required when welding the part cold. As before stated, preheating is a measure of economy as well as insurance against failure.

Steel castings in general may be beveled for welding with the cutting torch. Some grades high in carbon may resist the action of the torch considerably and make beveling somewhat difficult in which case beveling may be deferred until the parts have been preheated. Then usually no trouble whatsoever will be met in using the cutting torch.

Sizes of Welding Rods

One of the points to be observed in the use of welding rods is to choose a rod of diameter appropriate to the thickness being welded. The heavier the weld the larger the welding rod up to a certain limit but it is not common to use welding rods for steel larger than 3-8 inch diameter, and most welding is done with rods of from 1-16 to 1-4 inch. Thin steel up to 14 gauge should be welded with 1-16 inch wire; 14 gauge to 10 gauge with 3-32 inch wire; 10 gauge to 1-8 inch, 1-8 inch rod; 3-8 inch to 1-2 inch 3-16 inch rod, from 1-2 to 1 inch, 1-4 inch rod; and for greater thickness use 3-8 inch rod. The rule is not arbitrary but the welder can readily see that it is uneconomical and poor practice to use small welding rod on heavy work. It will cost much more for rod, and time will be lost in feeding the rod to the weld. Moreover, the smaller the rod the greater the surface proportionately exposed to the air and the greater the amount of oxide lost. On the other hand it is not good practice to use a large rod on small work because too much of the heat is absorbed in the welding rod, radiated and lost. The rule for welding is to make the heat of the puddle melt the welding rod; if the rod is very large and heavy so much heat will be abstracted that it will be difficult to keep the puddle in fluid condition with the appropriate size of tip and flame. Cast iron welding requires somewhat heavier rods or sticks proportionately, a 3-8 inch stick being commonly used on cast iron where a 1-4 inch rod should be preferred on steel. Cast iron sticks melt readily and less radiated and puddle heat are required than for steel rods of the same diameter. It would not be desirable to lay down a fixed rule because considerable latitude is allowable, and if a welder observes sound torch practice he cannot go far astray in the choice of welding rods and sticks.

NEW MACHINE DEVELOPED VARIOUS FEATURES

Continued from page 64

of oil not only to the V's but also to all the drive shaft bearings. This eliminates cutting and reduces friction and wear to a minimum. The operator's time is also saved as he does not have to oil these bearings. The pump is of reversible type, operating on the return as well as or the cutting stroke. From the pump the oil flows through a filter, thence to a hole in each "V" at the center of the bed. Each table "V" has a large oil channel running the full length but closed at the ends. From this channel the smaller supplementary oil grooves carry the oil to all parts of the bearing surface. By this means the oil supply is kept constant at all points regardless of the relative position of the table. Oil strainer, filter and settling basin are also provided.

Lack of space prevents further details. Description will be completed in next issue.

ANNOUNCEMENT

Garlock Machinery Limited

WE have taken over the assets and good-will of the GARLOCK WALKER MACHINERY LIMITED, TORONTO, including the premises and organization. We will carry an extensive line of metal-working and wood-working machine tools and supplies, and wish to take this occasion to emphasize to the trade that our aim is to give prompt, efficient and courteous service on all occasions.

LOWER COSTS
First Step to
BIGGER PROFITS

A CANADIAN Manufacturer was asked by a Lincoln Sales Engineer the other day if he was taking advantage of this slack period to check up on his factory costs. The manufacturer replied, "I suppose you want to talk to me about Electric Welding. We have done some welding in our plant, that is, Oxy Acetylene Welding, but most of the tanks and steel structures we build are riveted."

"Instead of talking Electric Welding to you, suppose I talk costs. You, no doubt, secure a certain number of repeat orders: in other words, you may get an order very soon to build a tank the same as you built once before. You know what your costs were in the previous case. Let us help you find out what your costs would be if this tank was electrically welded. You prepare the tank for welding with our co-operation. Send it to our shop in Toronto and either come to Toronto yourself or send one of your engineers to watch the work being done. You can check up on the time it takes, the material used, and the power required. With these three items you have the complete cost. You can then compare this with your previous method. We will give you a price on this welding if you want us to do it, or we will give you a price on a Lincoln Welder capable of handling this work and will supply you with an operator or train a man for you. This is as far as we can go. The rest remains with you. If your figures prove to you that you should buy an Electric Welding outfit now, or at some date in the future when business improves, you will do so without any persuasion on our part."

The Manufacturer was impressed with this proposition but made the side remark that recently they had bid on a good deal of work which they had not secured, thus presenting another argument why he should lose no time in checking up his costs to see if he could not get them on a lower basis allowing him to quote prices that will bring profitable business.

We maintain an Electric Welding shop in Toronto where we have handled during the past three years between two and three thousand jobs. We have just completed welding on the first two penstocks for the new Hydro Electric Power Plant at Queenston. Our shop practice and welding costs are freely available to any manufacturer in Canada, and we might say that during the past few months we have had frequent visits from shop superintendents, shop foremen, and engineers checking up on some particular piece of work with a view of reducing their factory costs or putting a new article on the market that will compete where they haven't been able to compete in the past. The Lincoln Electric Company of Canada, Limited, Head Office and Works: John Street, Toronto, Phone Adelaide 7200.

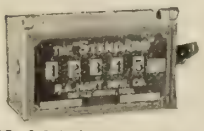
Buried in the Work and Broke!

Next time a tap breaks below the surface of a large casting, don't let some makeshift method of removing it injure the thread and waste half an hour of valuable production time. Instead—

Walton it Out in a Jiffy

And save the casting.

Special analysis steel fingers of the Walton Extractor drop into the flutes of the broken tap—and grip. Then a few turns of a wrench applied to the squared end of the Extractor backs out the buried tap.



Sixty-day trial offer proves the Walton Extractor pays for itself. Write.

Do Your Castings Cost Too Much?

A rearrangement of your patterns might cut their cost 25 per cent.; a different method of molding them might double your production at no increase in molding cost. We can advise you and we have expert metal and wood patternmakers who are able to make any changes that may commend themselves to you.

If you need some new Patterns

send us a sample, blueprint or sketch, and ask for our advice. It won't cost you anything. If our advice is good and commends itself to you, it is only fair to assume that our work will be equally satisfactory, and we need the work as badly as you need the patterns.

We are in a position to do turning, boring, drilling or other semi-finishing operations on castings supplied by us. Ask us.

We have for our and your requirements, a large stock of assorted White Iron Stars, suitable for light agricultural to medium weight machinery castings, while they last, at 8 cents per lb. F. O. B. Galt.

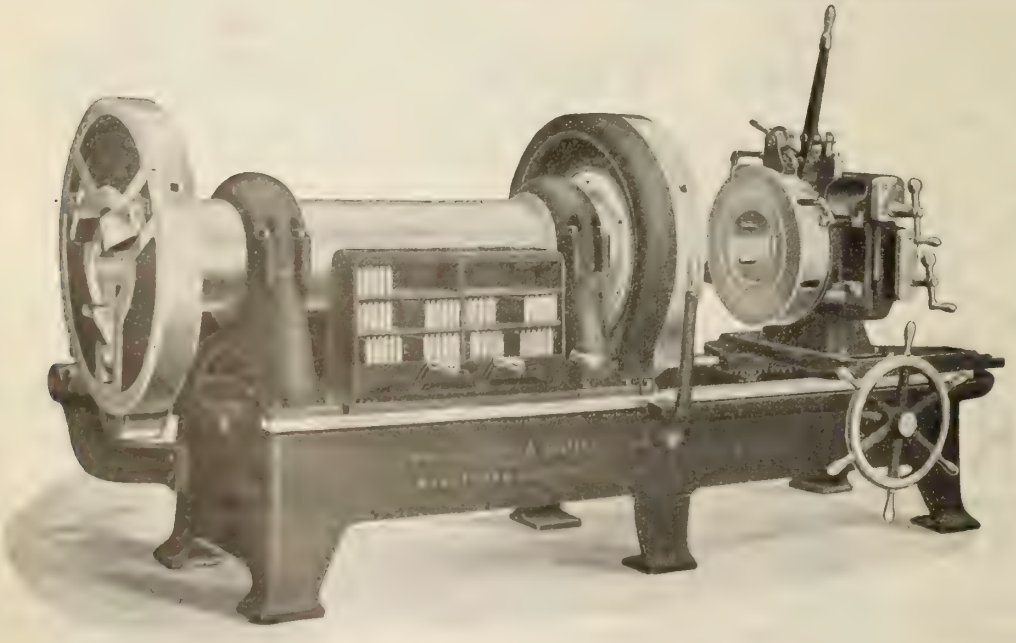
When Canadian Hall Joined with U.S. Williams

A Great Day for Pipe Machine Users

IN CANADA when you think of pipe machines, the name Hall immediately comes to mind. In the United States it's the Williams machine that has won the reputation to thread pipe better, quicker and at lower cost. Now the advantages of both are combined in each. They have joined forces and the Hall is now the Williams of Canada.



Whether it's 1-8 inch or 16 inch pipe or any of the sizes in between, there's a Williams machine just right for the job. Built in eight sizes and each size especially designed to meet the requirements of the case. And remember, each Williams machine is backed by the combined features, experience and service of Hall of Canada and Williams of the United States, each a firmly established leader in its field.

You who do or should use power pipe machines will do well to write for the details of how and why this merger means greater economy, production and efficiency in pipe threading practice.

Ask for the new Williams' handbook "Don't Let It Happen To You."

Williams Tool Corp. of Canada, Ltd.

U.S. Plant: Erie, Pa.

The illustration is of our No. 8 new improved Duplex Type Standard, capacity 2½" to 8" inclusive.

WILLIAMS PIPE MACHINES

Standard Dimensions

Something New in Machine Screw Design

For the first time in the history of the Machine Screw business there has been established by us a definite **standard** as to dimension. This new feature makes it "easy" for the user. "Easy" because he is always certain of the correct style and make of taps to insure uniform fits.

If your screw machine operating costs are running high, get in touch with us. A great many parts can be produced by our process at a substantial saving.

A few of our parts are shown at the right. We make a high quality, long established line of standard and special machine screws, rivets, threaded wires and specialties in headed work.

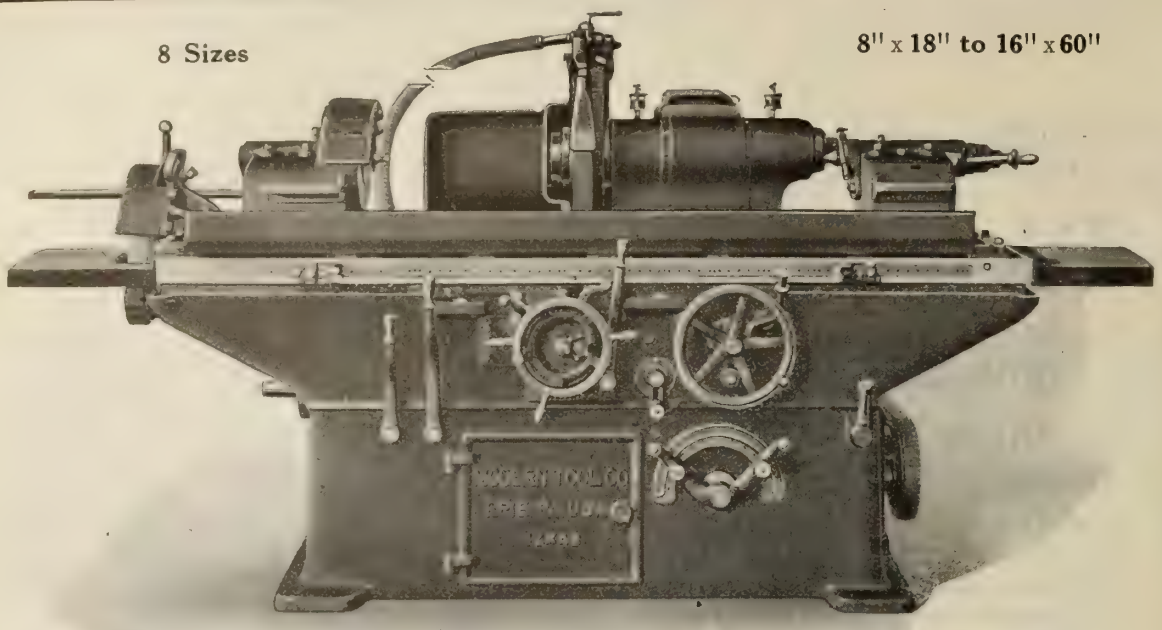
Torrington



MACHINE SCREWS

The Torrington Co., Limited

Upper Bedford, Quebec

8 Sizes

8" x 18" to 16" x 60"

MODERN
Plain Grinding Machines

Main Drive

The shaft is ground, and mounted on anti-friction bearings; runs at constant speed. Power can be applied from a line shaft or direct from motor. All parts are balanced to eliminate vibration.

Wheel Drive

More powerful than other types of same rating. A 4 in. endless belt carries the full power from main shaft direct to wheel spindle, giving constant smooth drive.

Gear Case

All speeds and feeds are secured from one gear box, a separate unit, which may be readily removed for inspection or renewal of bearings. Gears are in mesh at all times, and are engaged with shaft by our patented positive ball drive clutch, which permits instant change. Gears of steel with hardened bushings run in grease.

Send Us

—Blueprints and specifications, and we'll tell you what a Modern will do on your job.

Motor Drive

A constant speed motor may be attached to the main drive shaft of the machine by belt, silent chain, or flexible coupling.

All Modern Plain Grinders are specially designed for most convenient connection to motor.

Wheel Side

Travel is on "V" and "Flat" ways, giving true, accurate movements and long life. A gib prevents raising of slide when heavy cuts are taken.

Bearings

Wheel spindle has bronze bearings with outside taper. Quick take-up for wear without dismounting is provided.

Main drive has anti-friction bearings.

Headstock has ball bearings.

Gear box has phosphor bronze bearings.

All provided with proper lubrication.

All shafts are ground.

These PHOTOSTAT Prints Save as much as $800 a Week

A well-known mid-western tool company writes:

"As a matter of fact, thirty draftsmen would be required to handle the work that ten draftsmen and one PHOTOSTAT now accomplish, which is a direct saving in salaries alone of approximately $800 per week."

Tracing isn't necessary, because you can copy with the PHOTOSTAT in a few minutes either a drawing, a pencil sketch or a blueprint which it would take hours, and in some cases even days to trace.

Even the best draftsmen sometimes make mistakes or omissions.

The PHOTOSTAT Makes No Mistakes
(Reg. U. S. Pat. Off.)
It makes photographic facsimiles.

Any steady office boy or girl can learn to run a PHOTOSTAT in a few hours.

The Photostat is not limited to copying drawings and blueprints. It is widely used for office copying work, such as letters, telegrams, reports, shipping lists, contracts, ledger pages, insurance records, graphs, and legal documents.

In all this work the PHOTOSTAT takes minutes where other methods require hours, and with the PHOTOSTAT there is absolutely no possibility of error.

The PHOTOSTAT will copy at original, reduced or enlarged size and with the same or reversed black and white values. In the advertising department it is a great time saver and also very convenient. It shows how drawings will look when reduced to size, and whether light or dark backgrounds will be more effective. It makes all the necessary duplicates for layouts.

Just ask for our Booklet the "PHOTOSTAT and What It Will Do."

RENOLD
SILENT CHAIN DRIVE

More Power

Less Waste

The Recognized Standard for Efficient Power Transmission

Twenty-six years' highly efficient performance in the finest plants in the country has built up an enviable reputation for Renold Silent Chain Drives. Absolute reliability in service with maximum efficiency and minimum maintenance costs has made "Renold" the universal name for power transmission chains. Renold Silent Chain Drives are applicable to any powers, no matter how small or large and not only are they silent in operation, but also unaffected by heat, cold or moisture.

Let Renold Chains solve YOUR power transmission problems, and ensure YOU maximum efficiency, durability and service. Our engineering service is at your disposal without obligation. Why not write us?

This Mark On Belting

Means the End of Your Belt Troubles

Scores of Plants Can Get Better Belting Service— *if they only knew it!*

No one can deny the fact that the average business man of to-day is unconsciously thoughtless in his habits. Thoughtless about his checks—thoughtless about his credits—thoughtless about the kind of belting he uses. *Not enough investigation, that's the big trouble!* If we can prove to you that

D. K. McLAREN'S Leather Belting

will reduce your breakdowns, will save you power, will cut your belting costs—isn't it worth looking into?

D. K. McLaren's Genuine British Oak Tanned Leather Belting can do these things—because it is made from the best hides and made right. Use the coupon below for more details.

Points to Remember

BACK LEATHERS—Every inch of D. K. McLaren Belts represents Flawless Backs of the hides of the choicest steers.

BRITISH-OAK-TANNED—Every bit of the hide's natural strength is preserved in D. K. McLaren's Belts by the expert use of this famous process.

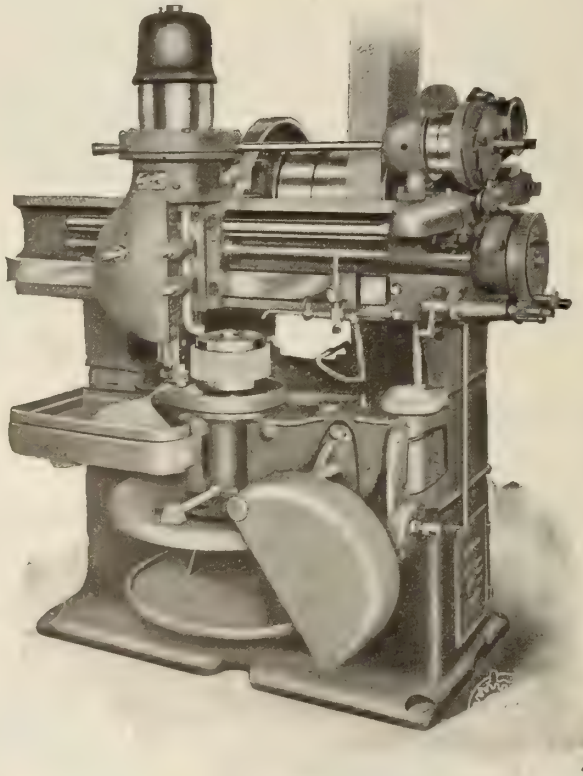
Gear Cutting With the "IFS" Left Out

The Gear Shaper Way



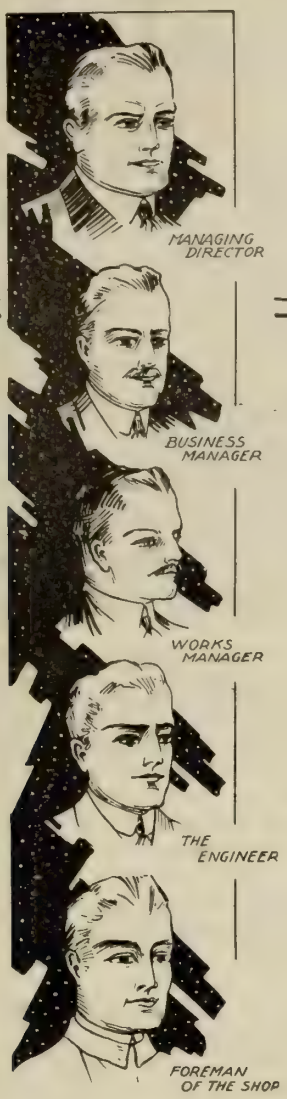
A production manufacturer knows that he will secure good gears IF he has an accurate cutter, an accurate machine and a machine working on the correct principle. The whole question of good gears is resolved in this little word "IF."

When the Gear Shaper was originally designed, the question of "IF" was taken into consideration and every possible means known to mechanical engineering was employed to eliminate the "IFS" from gear cutting.

That we have been successful in solving the problem is evidenced by the fact that each ensuing year sees a larger number of manufacturers adopting the Gear Shaper method.

How the Gear Shaper has accomplished this is clearly explained in our general catalog "Commercial Gear Cutting," which is a treatise on the subject of Gear Cutting with the "IFS" Left Out.

Send for your copy to-day



The Fellows Gear Shaper—the machine which has taken the "IFS" out of gear cutting

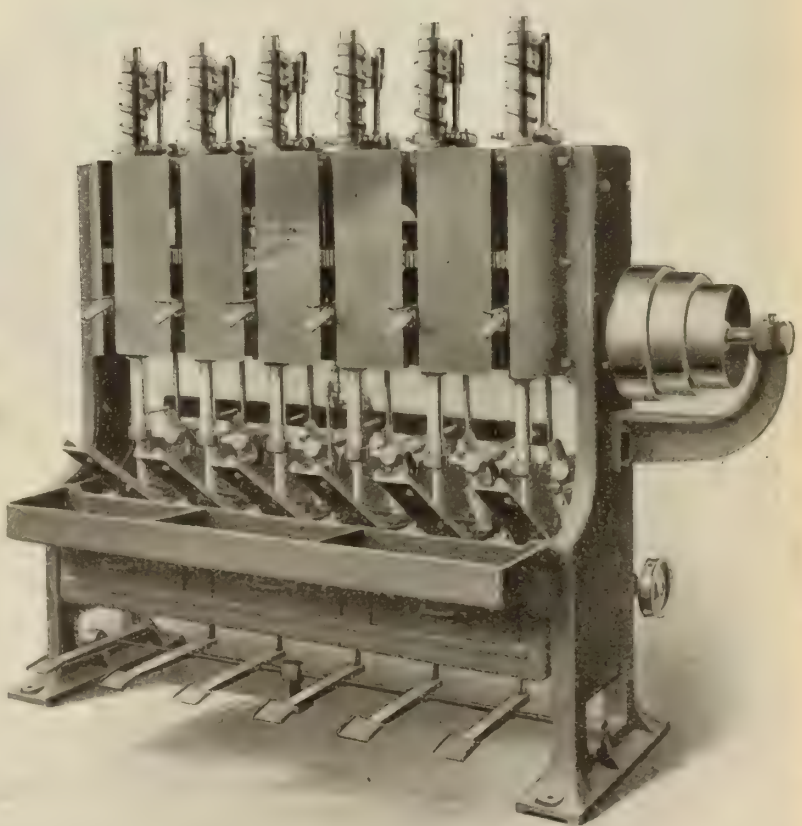
ACME
NUT TAPPING MACHINES



"Our production costs are much too high. We've got to cut down somewhere."
---The Managing Director

"I unfortunately know that and I've taken it up with the Works Manager."
---The Business Manager

"I've spoken to the Engineer and he recommends Acme Tapping Machines."
---The Works Manager

Here's what the Engineer said:
"One plant I know has been averaging 15,000 threaded nuts per nine hour day with Acme Nut Tappers. We need them here."

"I'm with you," says the foreman, "so I think there is satisfaction all round."

Acme Nut Tapping Machines most profitably meet to-day's demand because they are high-speed producers and capable of precision work under the most severe service. According to one leading manufacturer. "We get a spindle speed of 100 r.p.m. which is the limit of the tap endurance on the tough material used." **Wouldn't it interest you to know more?**

Illustrated Catalog on Request

It gives complete and up to the minute information about Acme Bolt, Nut, Rivet, Upsetting and Forging Machinery. Write for a copy.

Monel metal for superheat

HIGH machine speeds, constantly increasing demands on already installed steam lines, have forced power plants to superheat.

Commonly used "steam" metals cannot survive the chiseling attack of steam, superheated and under high pressures. So leading designers specify Monel metal.

Monel is used for guide stems, wedges, seat rings, spindles, pistons, etc., in great valves built by Chapman, Crane, Jenkins, Lunkenheimer, Nelson, Pratt & Cady and others equally prominent. It is used as blading, poppet valve parts, etc., in large steam turbines.

In power plant condensing and auxiliary apparatus Monel is used as meter parts, valve trim, pump rods and liners, etc. For only Monel combines the strength of steel with the ability to withstand the combined chemical and mechanical attack of high pressure and superheated steam, most acids and alkalies. Steam wear and water slippage is reduced to the minimum, machine life is lengthened, service is uninterrupted by costly shut-downs and expensive repairs.

Monel is being rapidly adopted for service calling for acid, alkali, high heat and steam wear resistance. It has a prominent place in the specifications of the largest engineering organizations in the country.

The International Nickel Company of Canada, Ltd.

Harbor Commission Building, Toronto, Ont.

The name Monel identifies the natural nickel alloy—67% nickel, 28% copper and 5% other metals—produced by The International Nickel Company. Monel products include Monel blocks, Monel rods, Monel castings, Monel sheet, Monel wire, Monel strip stock, etc.

LEAK INSURANCE

The Welded Tank answers ideally the demand of the industrial engineer for tanks which must be tight, strong and permanently leak-proof.

The oxy-acetylene process has made such tanks possible and

Prest-O-Lite

DISSOLVED ACETYLENE

because of its high quality and extreme portability has increased the usefulness of the welding and cutting torches a thousand fold.

Especially is this true wherever large cumbersome sections are to be welded —Prest-O-Lite can readily be carried anywhere—it goes to the job.

Tank makers are assured of the highest quality of gas and a constant and unlimited supply by using Prest-O-Lite.

A chain of plants and warehouses is kept busy meeting the demand for this most useful of gases.

Is Canada's Frozen North A Myth?

Vilhjalmur Stefansson, the Canadian explorer-author, in an article in MACLEAN'S MAGAZINE for December 1, entitled "Northward the Course of Empire," asserts that the stories of intense cold and other unendurable conditions in the sub-Arctics of Canada are all pure poppycock. He points out in this, the first of a series of four articles, that before the trans-continental railways were built, the same assertions were made regarding the fertile Prairie regions of Manitoba, Saskatchewan and Alberta that are now being made about the sub-Arctics.

Every Canadian interested in the development of his own country should be versed in the potentialities of the "wider Canada" beyond our present horizon of development.

The Christmas number of MACLEAN'S MAGAZINE, out

December First

is beyond doubt the finest in its history. There are contributions from such writers as Leacock, Agnes Laut, Alan Sullivan and Archie McKishnie; but MACLEAN'S did not gain its reputation by going after "names," and there are also other articles by lesser-known writers, including a delightfully poignant story by Frances Beatrice Taylor—her very first.

A Remarkable Offering of Timely Articles and Entertaining Fiction

Little Theatre of the Hills—Canada—by Agnes C. Laut: A plea for the development of Canadian national consciousness. Are we making the best of our national virtues and characteristics?

People Who Get My Goat—by Frederick Niven: A Canadianized Englishman has a few remarks to make about those newly arrived Old Country men who come out to Canada to make good and then indulge in bootless criticism.

Little Ukraine in the Canadian West—by Mrs. Charlotte Gordon: Something about one of our alien colonies which does not desire to remain alien.

Age and Occupation Determine Food Needs—by William Fleming French: An authoritative food article which answers the question "What Should Henry Eat?"—no matter what age Henry may be.

Is All Prayer Answered?—by Marshall P. Talling: A timely and entertaining article by a Canadian who has made a special study of prayer, what it means and what it achieves.

The Efficiency Christmas—by Zoe Beckley and Joseph Gollomb: A yuletide story with a laugh and a sob, a thrill and a heart-tug, about real people with the right sort of kiddies.

The Case of Jean Louis—by Maurice Le Blanc: The third of the Arsene Lupin series, by the master teller of fast-acting mystery tales.

The Ladies' Chain—by Alan Sullivan: A follow-up story on one of the most craftsmanlike pieces of fiction ever published in Canada, "Linen Sheets," which appeared a few months ago in MACLEAN'S.

The Usurper—By Archie P. McKishnie: The story about a lynx who was victorious in his battles with other savage things in the wilds and then challenged Man.

Pipes Over the Water—by Frances Beatrice Taylor: Three experienced journalists read this story before publication in MACLEAN'S and each voted it one of the most remarkable little stories of its kind he had ever read.

Mostly Sally—by Pelham Grenville Wodehouse: A big slice of the funniest thing which Wodehouse has written since "The Little Warrior."

The Yellow Streak—by Valentine Williams: The concluding instalment which unfolds the hidden-to-the-last secrets of this enthralling mystery story.

Stephen Interviews Leacock

By Stephen Leacock: Canada's premier humorist describes what happened when he was interviewed on his arrival in London; tells how the English questions left him all at sea because he missed the usual "bromides."

A Startling Review

"Can the White Race Endure in the Bright Sunlight of Western Canada?" Charles H. Huestis, M.A., D.E., here discusses the effect of light and warmth on our Western people. Twenty other reviews from British, French, American and Canadian current literature.

When it Comes to a Show-down on Carbonizing Economy—

CAN YOU SHOW—"More Heats per Dollar—More Uniform Results"?

YOU will, of course, recognize these two as inseparable, when it comes to real carbonizing economy—"More Heats per Dollar—More Uniform Results"?

And if you could make a thorough inspection of the hundreds of heat-treating plants in which Cast Nichrome Containers are used you would fully realize how inseparable are "More Heats per Dollar—More Uniform Results" and Cast Nichrome Containers.

The long guaranteed life of Nichrome Containers; their uniform behavior throughout their long life; the shorter heats and less fuel consumption they make possible and the practical elimination of spoilage due to cracks: These are Nichrome advantages that count for results that can be relied on. Are you ready for the proof?

Canadian Machinery BUYERS DIRECTORY

If what you want is not here, write us, and we will tell you where to get it. Let us suggest that you consult also the advertisers' index—last page of book, after having secured advertisers' names from this directory. The information you desire may be found in the advertising pages. This department is maintained for the benefit and convenience of our readers. The insertion of our advertisers' names under proper headings is gladly undertaken, but does not become part of an advertising contract.

DIRECTORY OF DEALERS

THE Buyers' Directory of CANADIAN MACHINERY was originally intended to contain information regarding lines actually manufactured by our advertisers. We now carry the advertising of leading machinery dealers, some of whom represent scores of manufacturers in addition to being manufacturers themselves in some cases. This necessarily widened the scope of our Directory, but it would be impracticable to list all the lines handled by all the dealers. We recommend, therefore, if our subscribers cannot find what they want in our Directory that they communicate with the dealers whose names appear herewith.

INTERNATIONAL MALLEABLE IRON CO., LIMITED

GUELPH, ONTARIO, CANADA

Malleable and Cast Iron PIPE FITTINGS

Made in Canada and Exported Abroad

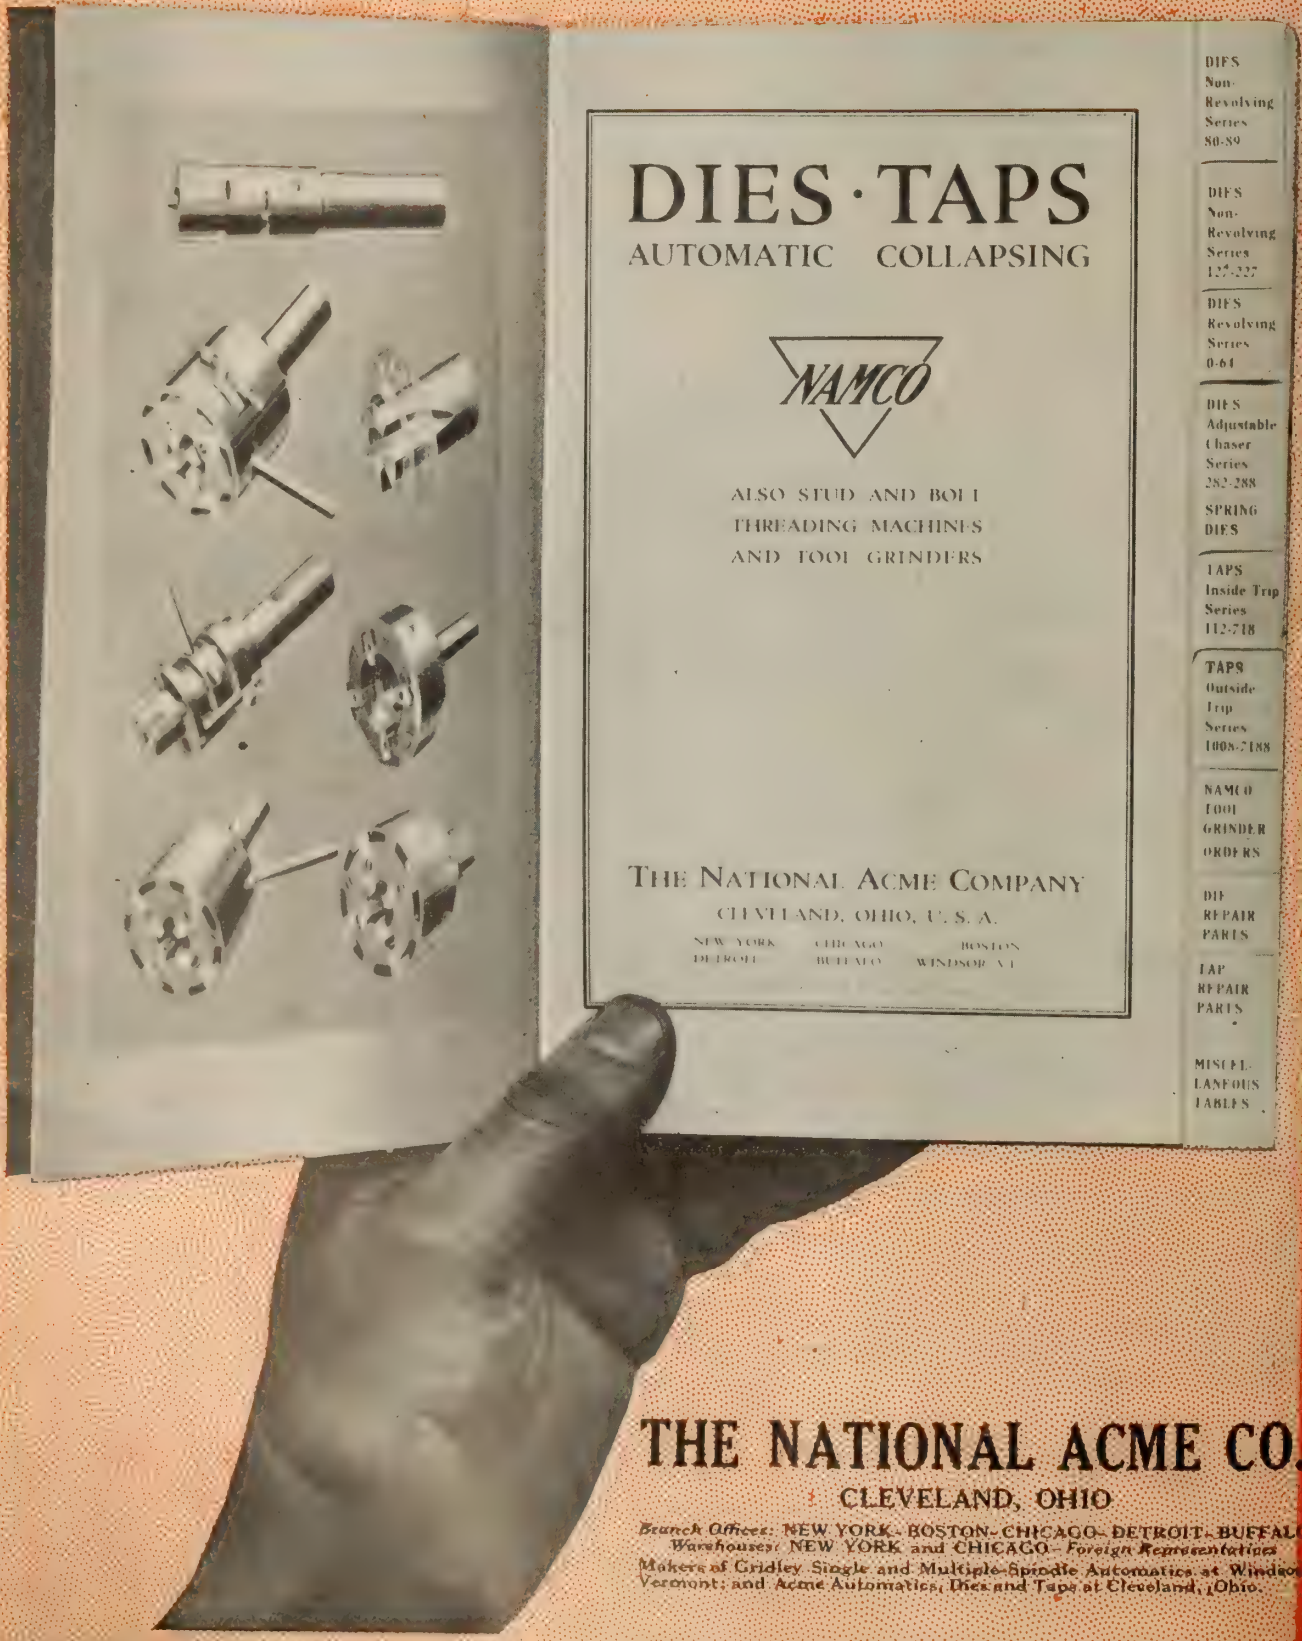
A LARGE plant, up-to-date facilities and thoroughly experienced staff place us in a position to offer unequalled quality, price and quick delivery on Malleable and Cast Iron Pipe Fittings; both screwed or flanged, black or galvanized. All sizes from 1/8 inch up.

We make a specialty of exporting our products and can furnish designs required in any country, such as the Whitworth or "V" thread in use in England, the Metric Pitch in France, or the W. S. Standard in use in Canada and the United States.

We will be glad to answer your enquiries

International Malleable Iron Co.

Limited



GUELPH, ONTARIO, CANADA

When you consider—

your threading costs, if you mean **low costs**, then you are using **Automatic** Dies and Taps.

And when you talk Automatic Threading Tools you are not certain that your costs are **lowest** until you've at least investigated **NAMCO DIES** and **TAPS.**

The book explains why. Want a copy?

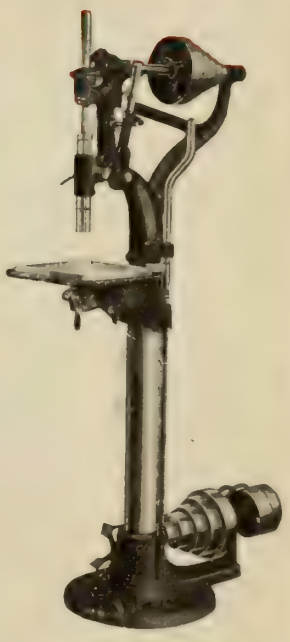
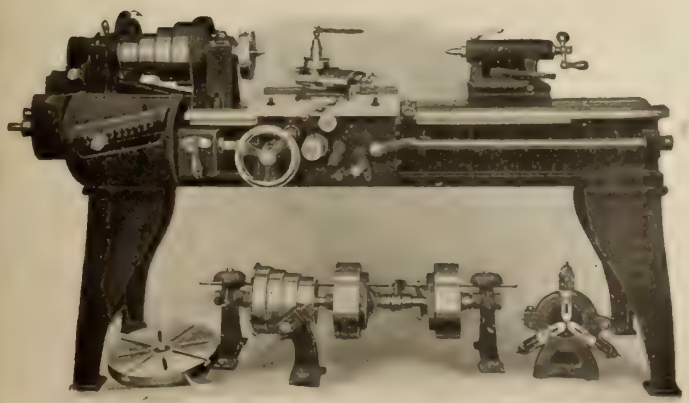
PETRIE



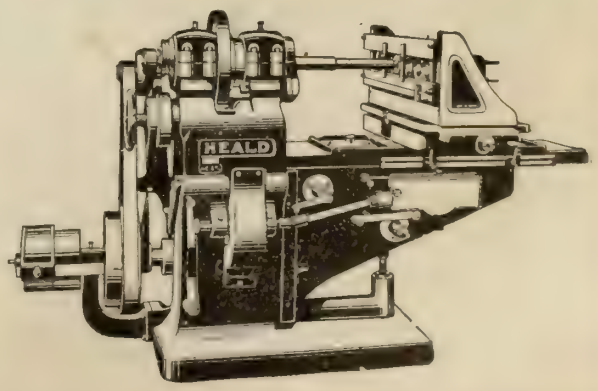
Canada's Dependable Machinery and Supply House

Offers You a Rare Opportunity to Purchase High Grade

MACHINERY



Over 130,000 feet of floor space in both our warehouses is stocked to the limit of capacity with Machine Tools and Supplies of every description. We must turn this stock over. This gives you an opportunity to purchase tools and supplies of the best make practically at your own price. Do you need Lathes, Planers, Shapers, Drill Presses, Punch Presses, Shears, Hammers, etc.? If so, buy now. In fact it will pay you to buy now for future use. Call and see our mammoth exhibit—or write, wire or phone your requirements.



Take Advantage of This Opportunity Today

H. W. PETRIE LIMITED

P & W

Pratt & Whitney Taps

"With the 'Con-eccentric' Land"

P & W Taps are **Good** taps—easily the best where accuracy and high speed are essential. They cost more to buy, but less to use than others.

If you're doing work that calls for big production and for unusual precision, give them a trial. You'll be back for more when you see them prove themselves.

The "con-eccentric" land — the special feature of Pratt & Whitney Taps, permits sharpening on face of the cutting edge without affecting size. It lengthens life and assures accuracy hitherto thought impossible in a commercial tool.

Safe and Economical, Yet Cheaper Than the Old Way

Storage and handling of lubricating oils is an item which, if not given the proper attention, will add seriously to your costs of operation. Bowser Equipment will store and handle your oil safely and economically.

The Bowser Fig. 172 is designed especially for making small quantities of oil easily available. Equipped either with a 25 or 54 gallon tank, it takes a minimum of floor space. The Piston-Type Measuring Pump delivers quickly the exact amount required. The leak-proof tanks eliminate leakage.

A Bowser in *your* plant will show you worth-while savings.

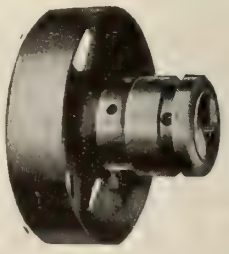
THE JOHNSON FRICTION CLUTCH

Install a Johnson Lineshaft Drive

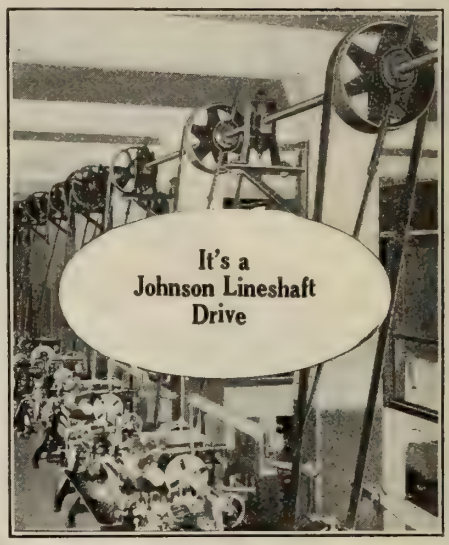
The practical experience of hundreds of our customers has established their belief in the Johnson Clutch Drive as the ultimate method of power transmission.

It replaces the countershaft, with its old fashioned tight and loose pulleys, and its troublesome overhead belting.

It avoids the expense of individual motors, and the waste of current they involve.



It substitutes reliable clutch control—economical in first cost, efficient in operation, durable under all kinds of service.

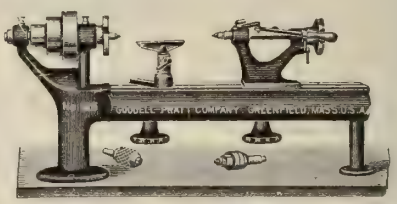


Friction Control Means Better Machinery

We specialize in friction clutches alone and can supply the right clutch for any drive. Hundreds of standard sizes in stock to fit all shaft and pulley dimensions.

"We are still using Johnson Clutches with very good success and have had them installed in our Nut Tapping Department for about ten years and at least half of that time they have been running night and day. We are also very greatly pleased with their operation in direct drives from lineshafts to lathes and other machines in our Machine Shop Department."

The National Screw and Tack Co., Cleveland, Ohio.



An installation made ten years ago on Lodge and Shipley Lathes. Still in perfect condition.

LOWER COSTS
First Step to
BIGGER PROFITS

A CANADIAN Manufacturer was asked by a Lincoln Sales Engineer the other day if he was taking advantage of this slack period to check up on his factory costs. The manufacturer replied, "I suppose you want to talk to me about Electric Welding. We have done some welding in our plant, that is, Oxy Acetylene Welding, but most of the tanks and steel structures we build are riveted."

"Instead of talking Electric Welding to you, suppose I talk costs. You, no doubt, secure a certain number of repeat orders: in other words, you may get an order very soon to build a tank the same as you built once before. You know what your costs were in the previous case. Let us help you find out what your costs would be if this tank was electrically welded. You prepare the tank for welding with our co-operation. Send it to our shop in Toronto and either come to Toronto yourself or send one of your engineers to watch the work being done. You can check up on the time it takes, the material used, and the power required. With these three items you have the complete cost. You can then compare this with your previous method. We will give you a price on this welding if you want us to do it, or we will give you a price on a Lincoln Welder capable of handling this work and will supply you with an operator or train a man for you. This is as far as we can go. The rest remains with you. If your figures prove to you that you should buy an Electric Welding outfit now, or at some date in the future when business improves, you will do so without any persuasion on our part."

Compensation Case — A production job in our own factory using Electric Welding to reduce our costs.

The Manufacturer was impressed with this proposition but made the side remark that recently they had bid on a good deal of work which they had not secured, thus presenting another argument why he should lose no time in checking up his costs to see if he could not get them on a lower basis, allowing him to quote prices that will bring profitable business.

We maintain an Electric Welding shop in Toronto where we have handled during the past three years between two and three thousand jobs. We have just completed welding on the first two penstocks for the new Hydro Electric Power Plant at Queenston. Our shop practice and welding costs are freely available to any manufacturer in Canada, and we might say that during the past few months we have had frequent visits from shop superintendents, shop foremen, and engineers checking up on some particular piece of work with a view of reducing their factory costs or putting a new article on the market that will compete where they haven't been able to compete in the past. The Lincoln Electric Company of Canada, Limited, Head Office and Works: John Street, Toronto, Phone Adelaide 7200.

BRISTO
REG. U. S. PAT. OFFICE
PATENTED SAFETY SET SCREWS

SET A NEW STANDARD

The distinctive dove-tail slots or flutes of the "Bristo" safety set screw are one of the features which put "Bristo" in a class by itself. "Mushrooming," for instance, is impossible, and splitting or cracking have been removed from the list of your manufacturing worries. As the wrench turns, the unique "Bristo" design contracts the screw; on releasing the pressure the screw tends to expand—a tremendous gripping factor.

Bright Spots In The Industrial Outlook

NO. 4

The accompanying cartoon aptly illustrates the lesson we have been endeavoring to inculcate by this series of advertisements, viz., that the present trouble with business is not so much that buyers refuse to buy as that sellers have discontinued their efforts or have made no special efforts to sell. We have given instance after instance of companies who have increased their business this year in spite of the general depression, yet in the very same lines in which these firms are engaged there are others who are bewailing the fact that business has gone to pieces.

Various reasons have been stated by the firms whose records we have given for the gratifying results reported, but one feature is always present, that is, increased sales effort. This is evidently the indispensable method which must accompany every other form of special endeavor.

Business can be secured by energetic salesmanship, judicious advertising to the merchant and to the general public is more essential and more important to-day than ever before. Our contention that where there is a will there is a way has been conclusively proved and it rests with each manufacturer or merchant himself to devise exceptional methods to keep business moving at its normal level or to increase it, instead of being content to sit still and await the coming of better times.

What's Wrong? What's Wrong?

Darling in Des-Moines Register

Moral: It isn't the public that has quit spending so much as it is business that has quit selling.

You can send your sales message throughout Canada from Coast to Coast by means of the following MacLean publications, all of which are members of the Audit Bureau of Circulations. Information regarding circulation, advertising rates and fields covered will be furnished on application.

LINK-BELT

CRANES AND HOISTS

THE Locomotive Crane is one of the most satisfactory machines for handling material, where conditions are right for its use. Today such a machine is low in initial cost—the upkeep is low, one man can operate it, and it can work for years, with ordinary care.

Practically the same thing can be said about the Link-Belt Electric Hoist—for lighter loads. Experienced plant operators found out years ago that it pays to handle material by machinery. Let us study your conditions, and make you recommendations. Catalogs and full particulars sent on request.

LANDIS

No. 4A SPECIAL GRINDING MACHINE

The Landis Grinding Machine can perform all the operations necessary to put the gasoline motor in first-class condition and repaired as good as new. The installation of one machine in your shop is not limited to work of any special nature, it is designed to handle any grinding operation connected with the repairing of automobile, truck, tractor and other gasoline engine parts.

Let us show you what Landis Machines can do for you. Write to-day for literature.

Self-Promotion And Sales Promotion

Are you interested in any of these fields—power—metal working—marine? As a manufacturer, or purchasing agent, as a superintendent or foreman, as an ambitious mechanic or engineer?

Use These Publications

They will keep you strictly up-to-date in all branches of mechanical engineering. Edited by practical men. Cheerful, inviting, instructive, authoritative.

POWER HOUSE

Twice a month—$2.00 per year.
Serves the power plant engineer—Steam, Electric, Refrigeration, Hydraulic.

CANADIAN MACHINERY

Weekly—$4.00 per year.
Covers the metal working field—serving shop executives, purchasing agents and owners. First-class mechanical paper and market paper combined.

CANADIAN FOUNDRYMAN

Monthly—$2.00 per year.
A paper for the foundry owner, superintendent and foreman. Claimed by its readers to be unexcelled.

MARINE ENGINEERING

Monthly—$2.00 per year.
Interprets marine engineering in its broadest sense, serving the shipbuilders, navigation companies and their officers. (The editor holds an extra first-class B.O.T. certificate.)

Problems Met With In Machine Shop Work

Machining an Adjustable Shaft Support—Fixtures Used on Different Operations—Widening Standards on a Planer—Rigidity Maintained—Overhanging Work Support for Open Side Planer

Machining Adjustable Shaft Support

By F. Scriber.

TO OBTAIN the desired degree of accuracy on many classes of work, it is advisable when machining the same to take into consideration the relation of the finished surfaces of more than one part, or in fact of several parts, before deciding on the method of tooling or machining any one part. After consideration of the portions A and B, Fig. 1, it was decided that the best method to be followed in machining was to handle them together as one unit throughout the various operations, followed by finally cutting them apart.

With this end in view the following sequence of operations was decided upon: First, drill hole C, spot face one side of this boss, and the same side of bosses D and E, also drill, ream and tap hole F, followed by spot facing of boss G. Second: mill three bosses at reverse side of piece. Third: mill both vee grooves and lug H, making three settings; fourth: saw apart at J, thereby completing the machine work. To accomplish this jigs or fixtures are provided which are illustrated in Figures 2, 3 and 4, a description of each, together with the method of using, is given below.

Referring to the drill jig, Fig. 2, the work A is located by the boss in a vee block B, it being necessary to rest the boss on a bushing C. At the extreme end of the boss having the tapped hole in it, another vee block D, is provided which locates that end; a clamp E, being used, which is cut away in the centre to provide two spots, which in addition to clamping the end, squares the work from the long vee boss against which it clamps. This clamp is pivoted at F, and a screw, G, is used for tightening purposes, while spring H, pushes the clamp away from the work when it is desired to remove the same. In addition, a screw, J, in combination with a screw, K, supports the other end at the boss. These various units securely hold and locate the work from the rough casting while the holes are drilled, reamed, tapped and the bosses at the open side of the jig are faced together with the boss at the tapped hole. Slip bushings are used for guiding the drills and reamers, the same being removed while spot facing and tapping.

The next operation, which consists of spot facing, the three bosses at the side opposite to that which was machined in the jig, is done by vertical milling, using the fixtures shown at Fig. 3 for holding the work. At this time advantage is taken of the bosses previously machined for locating purposes as the work rests

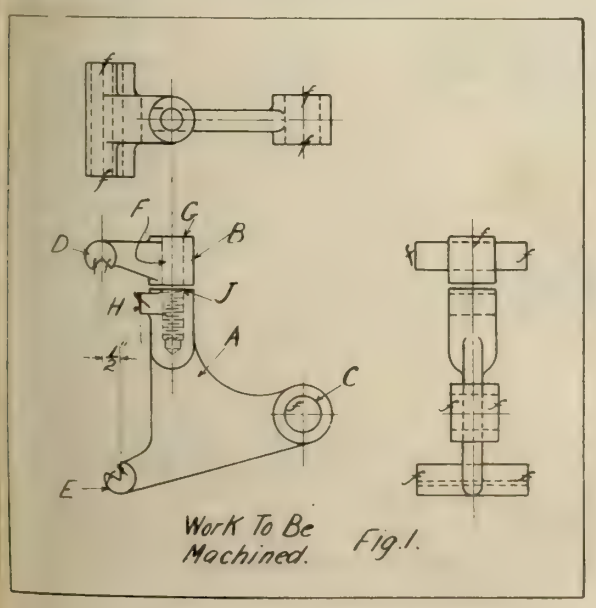

Fig. 1.—Showing the Shaft Support.

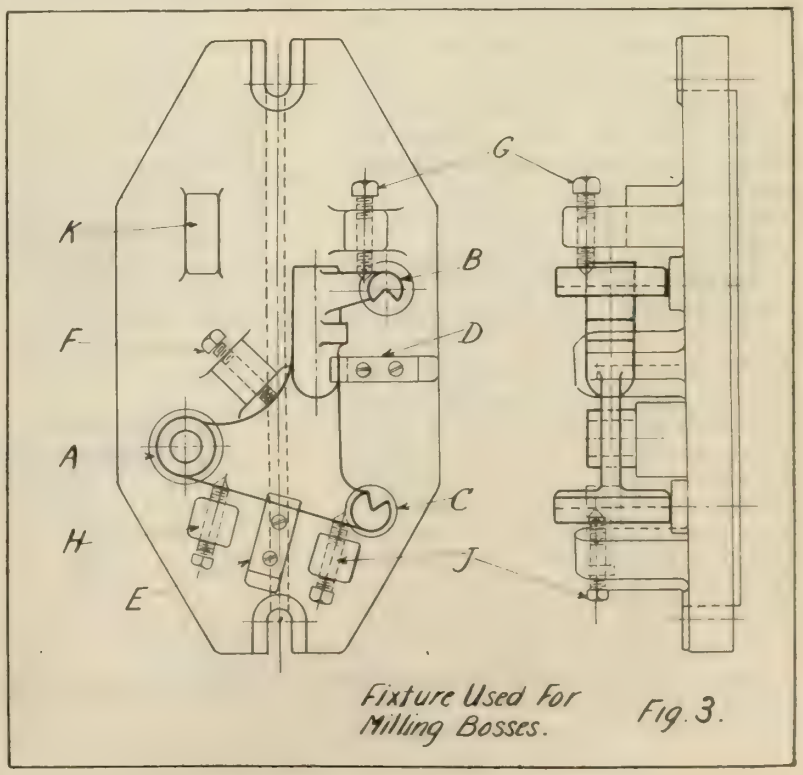

Fig. 3.—Fixture Used For Milling Bosses.

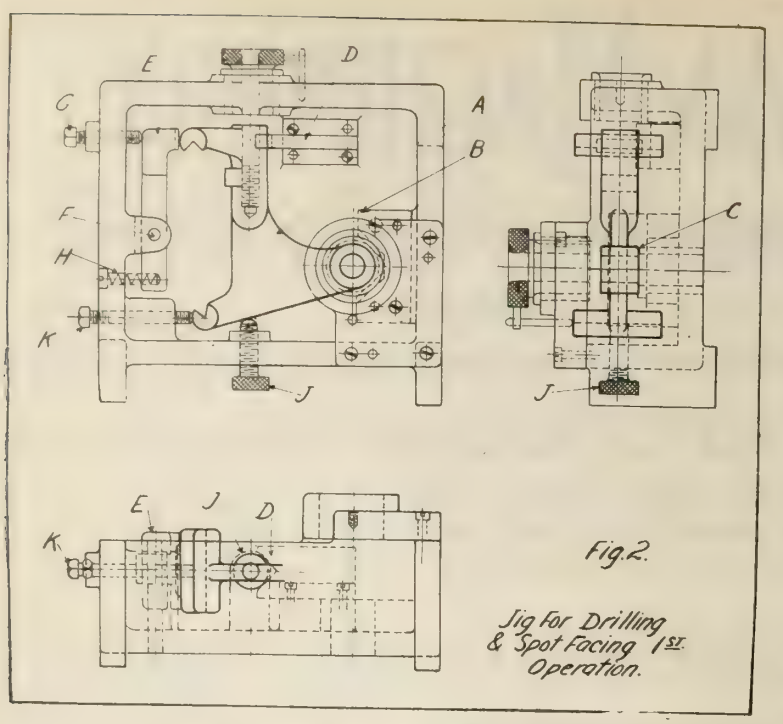

Fig. 2.—Drilling and Spot Facing Jig.

at A, B, and C, on finishing lugs on the fixture casting. In addition a block D, and a block E, are provided, against which the work is pushed by means of the set screw F. Following this the screw G, is tightened against the work to securely hold the boss at that end against the strains of the milling cutter. Screws H and J are then tightened to hold securely the respective bosses, and it is found in practice that this arrangement makes a very substantial holding method for performing the vertical milling operation. It will be noticed that on this fixture a finished surface K, is provided, the object of this being that blocks of suitable thickness may be interposed between this surface and the milling cutter for setting, so that the bosses will be milled the correct length measured in a vertical plane.

Perhaps the most interesting part of machining this piece is that done in the fixture, Fig. 4, three settings in the same fixture being necessary for milling the two vee slots and the finished pad. At this point it is advisable to locate from the hole A, by means of a plug over which the work is slipped. A pin B, is then pushed in the other hole to locate the work radially about the stud at A, and this is clamped by set screw C. A large strap D, having lugs at its three extreme corners is held in place by a set screw E, entering a hole at its center. This is used to clamp the work, it being of very substantial nature.

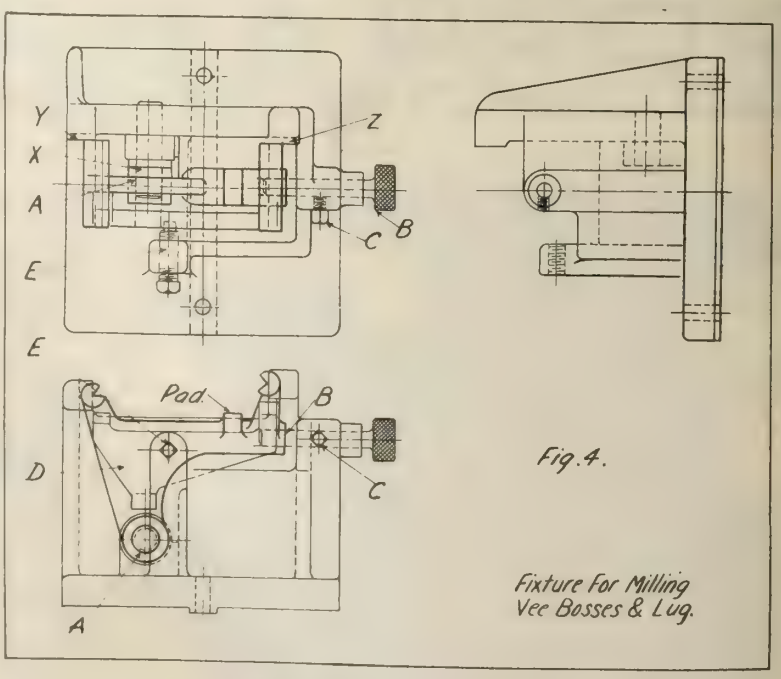
It is found to be sufficient to hold the same in place, as the fixture is fed so that the strain of cutting comes against the solid wall of the fixture. It will be noted that in clamping the work, it rests against a shoulder on the stud at X, and the finished surfaces Y and Z, of the fixture wall. It will be obvious that formed cutters held in a vertical plane are used to mill the vee grooves, while a plain surface mill is used for the lug. To complete the machining of this piece all that is necessary is to set the piece up on a milling machine using a vise to clamp the two vee bosses while it is sawed apart at J, Fig 1, thus the two pieces which are both marked with the same number are machined so they will work together with very little fitting when mounted in place on the slide of the machine to which they fit.

Two Planer Hints of Value

By H. A. WILSON

A rather unique method of increasing the capacity of a planer, in so far as width of work accommodated between standards is concerned, may be seen in the shop of the Dominion Engineering works at Rockfield, P.Q. The machine on which the extension was made is a 60 inch x 60 inch Pond planer. The standards were opened up about 21 inches. On the side of the planer, remote from the drive, a large block casting, suitably cored out, has been placed between the standard and the main frame of machine. The shorter studs that originally held the standard to the frame have been replaced by longer studs which are screwed in the frame and pass completely through the extension block, on through the standard, against which the nuts are tightened, clamping the whole structure together.

A similar method of extending the casting which bridges the standards at the top has been employed. In this case, however, the original casting permitted the use of bolts instead of studs. In both cases slots or shoulders have been planed in the extension blocks to accommodate the design of the original pieces, assisting in the locating and holding of the various parts when assembling, and lending rigidity to the machine under operating conditions. The bevel pinion shaft which operates the screws raising and lowering the cross rail has been extended by use of a long sleeve coupling, hooking up the two pieces of shaft. It was found that the old cross rail could be refitted to the standards after they had been widened out. Two heads are mounted on the cross rail.



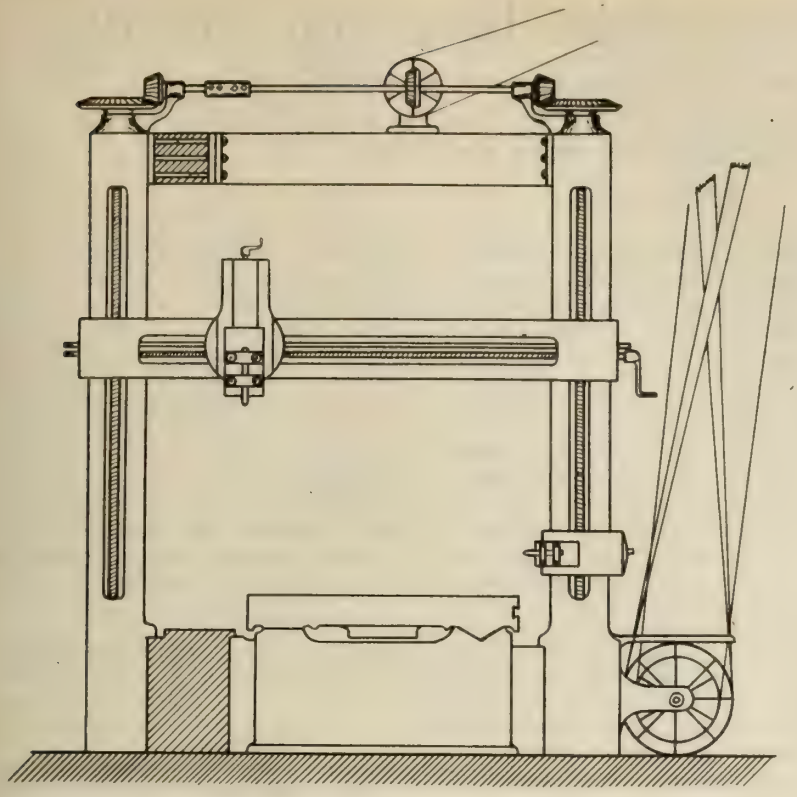


Fig. 4.—Fixture Used to Mill Vee Bosses and Lug.

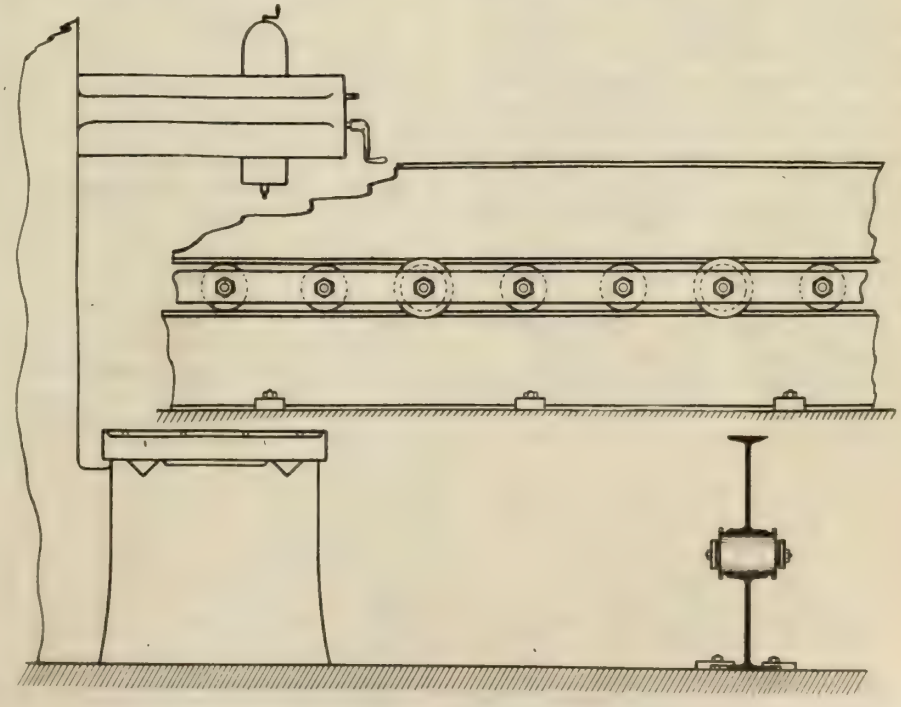


Sketch Showing How Planer Was Widened.

The significance of this bit of engineering is not realized at first glance. When one considers ordinary planer jobs, it is not once in a blue moon that the capacity of a planer, in height accommodated under the cross rail, is taxed, but it is a common trouble to get work in hand that won't pass between the standards. This sixty inch machine will take in a piece nearly seven feet wide, yet none of the rigidity of the machine has been sacrificed. The table has not been increased in width and therefore all the good points of the smaller machine have been retained with the added capacity thrown in. The outfit has been grouted in cement and is a permanent fixture. Another feature is that the cost of the whole job has been very moderate.

OVERHANGING WORK SUPPORT FOR OPEN SIDE PLANER

Frequently a job of planing some very wide casting is routed to an open side planer of moderate dimensions. Ordinarily great difficulty would be experienced in holding the work during the machining operation. The writer recently ran across a very simple, but yet ingenious little fixture which enables the Dominion Engineering Works to handle very bulky pieces on a small open side planer.

A 12-in. I beam is strapped to the floor, its length being only slightly less than the length of the V slides in the frame of the machine. The flanges of this beam are 5 1-2 inches wide. On the top of this I beam are placed a number of turned C. I. rollers 6 inches diameter and 7 inch face spread at 12 inch centres. Each roller is mounted on a steel pin 1 1-2 inch diam. and theee pins pass through two steel side bars 3 1-2 inch by 1-2 inch being held by nuts as shown in Fig. 2. Every third roller is flanged and has a face of 6 inches between flanges. On top of these is placed another 12-ich I. The top of this latter I beam is flush with the top of the planer table. Work wide enough can rest on this top I beam and be supported in this way. As the apparatus is placed about eight feet from the near side of the planer table often there are jobs that will not reach out to the rollers. Parallel bars, however, can be stretched across the gap and work bolted to the table using the bars as packing pieces. It is a simple little apparatus but an extremely useful one on many occasions.

Overhanging Work Support Which Is Found To Be Very Useful.

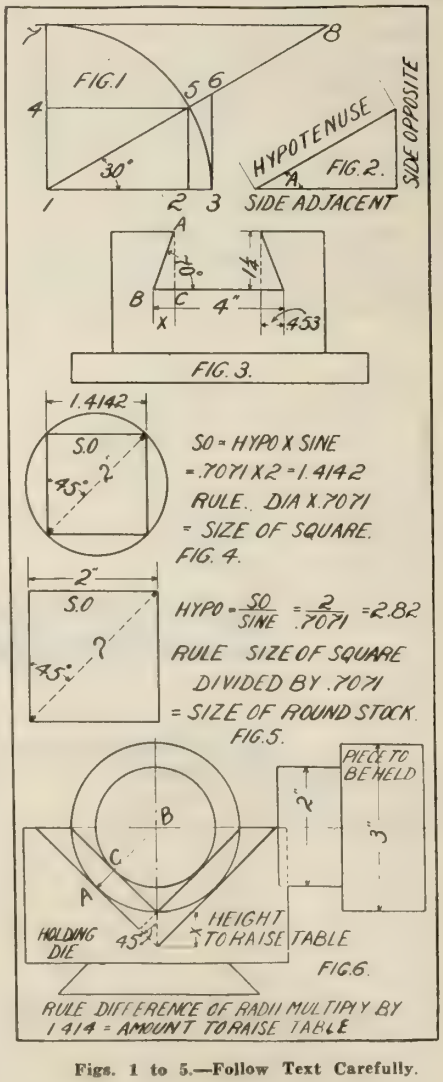
A DIRECTION INDICATOR

The look-out man on a ship is now able to directly indicate whatever information he desires. A British firm has brought out a special look-out telegraph which enables a man to transmit to an indicator, which may be fixed at any point of the ship, information regarding the exact bearing of any object he has sighted. The look-out man observes the object through a simple form of open sight which can be raised or lowered as well as turned around; and when he has sighted the object he touches a bell to give notice to the navigating officer that something has been sighted. At the same moment the pointer on the indicator shows how many degrees to port or starboard the object is. A reply circuit is provided so that the navigating officer can inform the look-out man that the information has been received. By mounting the indicator in a particular position the pointer can be regulated to point in the direction of the object sighted. The same firm has introduced another electrical appliance for mounting the revolutions of an engine or other machine. The principle involved is quite novel and very little energy is required to operate the appliance, which gives very accurate readings.

A Neglected--Yet Most Essential Study

Machinists Should Make It a Point to Learn Workshop Trigonometry—It Is Not as Difficult as Some Imagine and It Lends Itself to Many Machine Shop Problems

By J. DAVIES



WORKSHOP trigonometry is the most useful form of mathematics for the machinist, yet, somehow or other it is the most neglected. Most shopmen, as soon as they run up against any formula that requires a knowledge of trig., conclude that it is too hard for them, whereas an elementary knowledge of such is as simple as any other form of arithmetic. It is really a system of constants based on the fact that there are always fixed proportions between the sides and angles of triangles and other figures.

A table of trigonometrical functions or tables is included in most machinist handbooks, or can be bought at any bookstore for a few cents. These tables give the exact proportions of various parts of a right angle triangle. The figures given are simply multipliers or constants for a Radius of 1", or for a right angled triangle whose hypotenuse is 1". For any other radius we multiply the number given in the table by the radius we are using. These tables form the most convenient and accurate method of solving many shop problems as will be shown.

The tables can represent anything such as inches, feet or meters, and the answer will be in the same unit, but we will confine our workshop calculations to inches only. Everything is based on the radius of a circle and the figures in the table are all based on a radius of one inch. Figure 1 is a circle whose radius is one inch lines 1 to 3, and lines 1 to 7 are the radii and form a right angle with each other. To show the different functions of the angle, we will construct an angle of 30 degrees. Line 1 to 5 represents the hypotenuse and is also the radius. A line dropped from 5, meeting the line 1 to 3, and being perpendicular to it is called the sine, and is shown by line 5 to 2. Line 1 to 2 is the cosine. A line tangent to the circle 3 to 6, and meeting the line 1 to 5 extended, is called the tangent. A line tangent from 7 meeting the line 1-5 extended to 8 is called the co-tangent. These are the principle functions, the others can be seen by reference to the figures.

Lines 1 to 3, and 1 to 7,=Radius.
1 to 2=Cosine
2 to 3=Versed sine
4 to 7=Co-versed sine
2 to 5=Sine
3 to 6=Tangent
7 to 8=Co-tangent
1 to 6=Secant
1 to 8=Cosecant.

It must be distinctly understood that the angle refers to one side of the center line only and not to the total or included angle. The reading of the tables is very much like reading a railway time table. On the left a table of angles 0° to 45° are found, and from this column and the columns marked at the top by the word sine, tangent, etc. The value of these ratios may be found for any given angle, at the right, and usually reading from the bottom up, these angles are continued from 45° to 90°. The ratios for these angles are indicated at the bottom of each column. Thus given an angle of 20, we find 20 marked in the column representing the angle, and corresponding to this in the column marked sine we have the figures .34202. Thus, sine of 20 is .34202. By referring to column marked tangent and cosine, we find tan of 20 is .36397 and Cosine of 20 is .93969. To find values for an angle greater than 45, say 65, look in the right hand column marked sine, etc. At the bottom reading upwards and we find the sine of 65 to be .90631. All the different ratios for any angle are read in the same manner. Every right angled triangle contains three sides and three angles. Perhaps they can best be remembered by reference to Fig. 2.

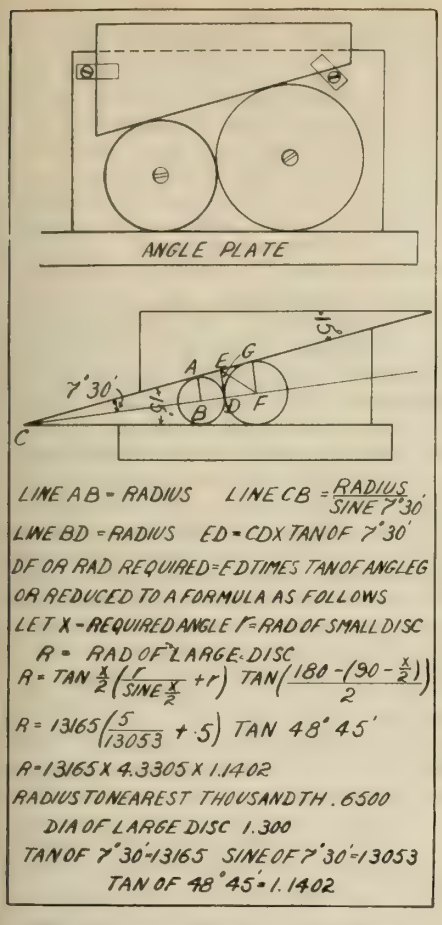
Figs. 1 to 5.—Follow Text Carefully.

Suppose A is the angle under consideration. The long side is always the hypotenuse. The side next to angle A is the adjacent, and the third side is the side opposite. By remembering this simple explanation the following formulas can easily be applied.

$$\text{Sine} = \frac{\text{Side opp.}}{\text{Hypot.}} \quad \text{therefore Side opp.} = \text{Hypot. x sine}$$

$$\text{Cosine} = \frac{\text{Side adj.}}{\text{Hypot.}} \quad \text{therefore Side. adj.} = \text{Hypot. x cosine or side opp.} = \text{side adjacent x tangent}$$

$$\text{Tangent} = \frac{\text{Side opp.}}{\text{side adj.}} \quad \text{therefore Side. adj.} = \text{Co tan x side opp.}$$



$$\text{Cotangent} = \frac{\text{Side adj.}}{\text{Side opp.}} \quad \text{therefore}$$

$$\text{Hypot} = \frac{\text{Side adj.}}{\text{Cosine}} \quad \text{or}$$

$$\text{Hypot} = \frac{\text{Side opp.}}{\text{Sine}}$$

A few practical examples taken from the workshop will show the application of these formulae. Fig. 3 shows a sketch of a casting as it came to the machine shop. The draughtsman was not as thoughtful as he might have been. You will notice that the dimension is given at the wide end of the dovetail and not at the top, with the result that the planer hand set his planer head over to the required angle and took a roughing cut off each side and then found he was too wide at the bottom and the work was spoiled. He had roughly measured the width at the bottom. But, it happened that the angle of the casting was not anywhere near the finished angle, and not knowing the width at the top, the result was a spoiled job. With an elementary knowledge of trigonometry he could have found out the width at the top for himself in a few minutes as follows.

Draw a verticle line, making a right angle triangle A. B. C. The angle at B is 70°. By applying one of the form

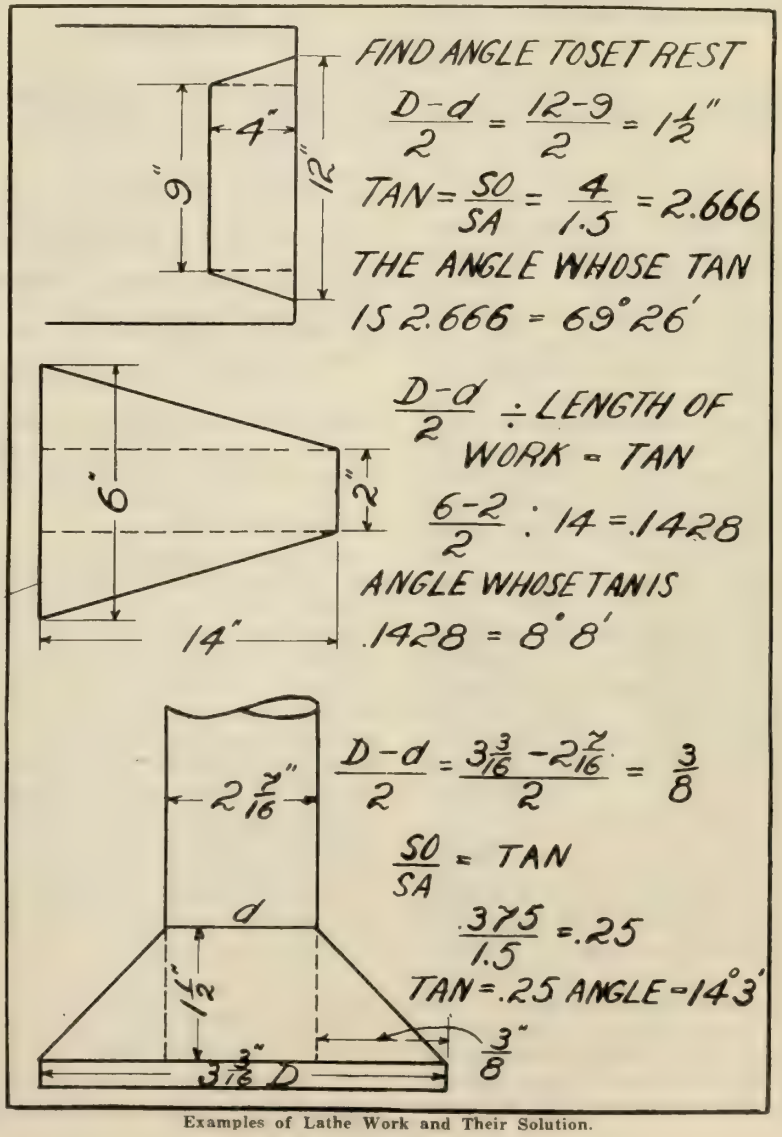
Refer to Text Matter for Explanation.

ulae given. Cotan x So.=Side adjacent Length X is found by multiplying cotan of angle 70° taken from table, and side opposite which is 1¼. Cotan x side opposite=side adjacent=.363 x 1.25=.453, or .453 on each side. .453 x 2=.906. therefore 4—.906=3.094. width at top.

Here are two simple shaper jobs.

Shaper Work

A round bar of iron 2″ dia. It is required to shape the largest possible square on it for use as a wrench. Form a right angle triangle inside the 2″ circle. It is evident that the Hypot will be two inches. The problem will then be to find the length of one of its sides. Formula: Hypot. x Sine=2 x .7071; 7071 being the sine of 45=14142. From this we get the general rule that the size of a square=Dia. x 7071. The next example is just the reverse, but still illustrates the same rule. We are to machine a piece 2″ square. What size must the round stock be? It is evident that the stock must be the size of the diagonal of the square or the Hypot.



$$\frac{\text{Side opp}}{\text{Sine}} = \frac{2}{.7071} = 282$$

Rule size of square ÷ 7071 equal size of round stock.

Here is another very practical job but a little more difficult to follow. A pair of jaw chucks are to be milled to hold the piece shown in perfect alignment. As both jaws are alike, we will consider one only. The jaws were Vee shaped and cut with a 90 deg. cutter. The jaw for the small dia. was cut first and could be cut to any size with reasonable limits. The problem consists in calculating the exact distance to raise the table to cut the large Vee so that the piece would lie in perfect alignment. The sketch shows two concentric circles, one 3″ dia., and one 2″ dia. The lines of the two vees in the jaw will be tangent to these circles and parallel to each other, therefore the problem resolves itself into one of finding how far apart these lines will be when measured in a vertical direction. The line A. B. measured from the point of contact with the Vee will equal the radius of the large diameter. The line C B, radius of small dia., and A C equal difference of the two radii. The line A B is at right angle to the face of the jaw, therefore a vertical line taken through the center of the piece will be at an angle of 45 deg. with A. B.

The length of this vertical line from point to point of the two vees will be the amount to raise the table. By reference to sketch you will see that the forms a right angle triangle. The difference of the two radii, forms the two sides, and the vertical lines between the apex of the two vees form the hypotenuse. Therefore the formula is— $\frac{\text{Side opp.}}{\text{sine}}$ =Hypoteneuse. Side opp.=Difference of rad. Sine of 45=7071 1″ .5-1″=.5÷ 7071=height to raise table. Quite a number of these jaws were to be made of different sizes so the following rule was deduced. Multiply the difference in radius by 1.414.

When milling the teeth in an end mill, or the side teeth in a side mill, it is neessary to cut one end of the teeth deeper than the other, in order to make the top of teeth, or lands, of uniform width. This being the case it is necessary to work out the depth of cut at the deep end to get the angle to move the dividing head. The depth of cut can be found as follows: Suppose an end mill is to have 10 feet, and the milling cutter has a 70 deg. angle. The center angle, or angle between adjacent teeth=360, the number of degrees in a circle divided by the number of teeth. $\frac{360}{10}$=36. The width of the cut will equal adjacent x tan of 36°. The length of the adjacent=

Examples of Lathe Work and Their Solution.

radius. It may be here stated that the diameter of the work makes no difference to our calculations as we will base all our calculations on a radius of one inch. The tan of 36° is .7265, therefore the width of cut is .7265. The depth of cut depends upon the angle of the cutter, and equals cotangent of angle of cutter x width. Cotangent of 70°= .3639. Cotan of cutter .3639 x .7265= .2643. Hence the dividing head must be set to angle whose cosine is .2643= 74° 49 minutes.

Lathe Work

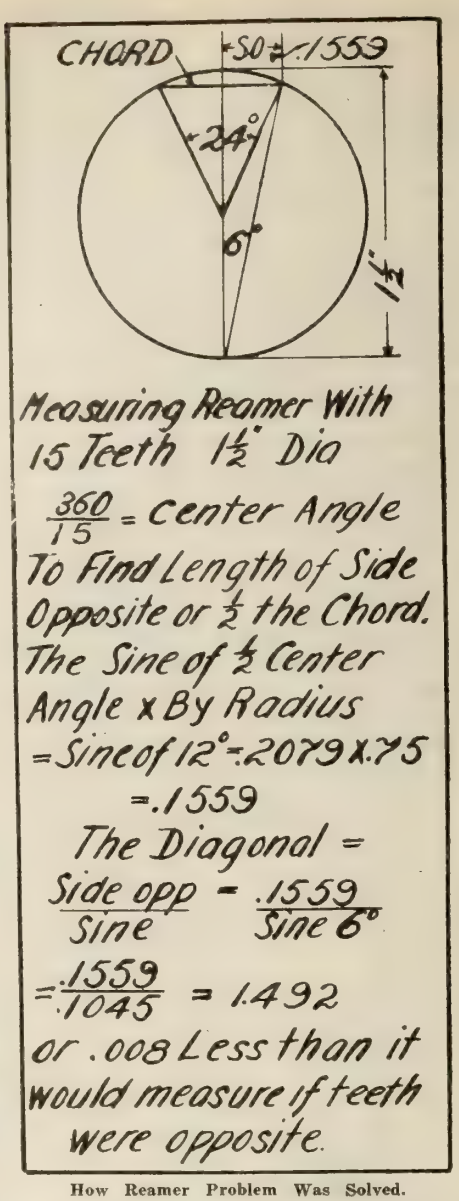
Some parts to dimensions shown, are about to be made. In many similar jobs, it will be found most convenient to swing round the compound rest and feed by hand. The angle to swing round the rest is taken from formula side opp

$$\frac{\text{side opp}}{\text{side adjacent}} = \text{tan.}$$

Another example somewhat similar in principle is a long taper. The most practical way is to set the taper attachments to angle required. Some taper attachments are graduated in degrees. We will suppose we are using an attachment graduated in degrees, applying the same formula as the last example. The side opposite will equal one half the difference of the diameter, and will equal $\frac{D-d}{2}$

$$\therefore \text{length of work} = \text{tan.} = \frac{6-2}{2} : 14 =$$

.1428



Angle whose tan is .1428=8 deg. 8 min.

This job came to the grinder before any trouble was experienced. It was an 1½" reamer with 15 teeth. It was all right for the lathe hand. He turned it 1½+.010 for grinder but when the grinder operator came to measure it, he found a space opposite a tooth. He had at least two ways to measure it. First wrap a feeler over the space and add the thickness of the feeler to measurement required, or calculate the distance across the two teeth nearest to the center as follows:—Make a circle equal to dia. required. Divide 360 by number of teeth, center angle. In order to form a right angle triangle we find half the chord. The sine of one half the center angle, multiplied by the radius. The inscribed angle is one half the center angle so that the angle that is formed by a line drawn through the center and the diagonal line drawn through the two teeth will=6 deg.

$$\text{Length of the diagonal} = \frac{\text{Side opposite}}{\text{Sine}}$$

=hypot. or diagonal.

This rule will work both ways, suppose the diagonal is known, or found by actual measurement to be 1.492. To find diameter of reamer center angle $= \frac{360}{15} = 24$ deg. angle formed by diagonal with center line=6 deg. The diagonal times the sine of6 deg.=Side opposite=.1559. Side opposite divided by the sine of half the center angle hypo, or radius $= \frac{1559}{2079} =$ .75 radius dia.=1½.

How Reamer Problem Was Solved.

One more practical example, perhaps the most useful of any. Suppose we wish to grind a flat gauge to any given angle. It might be an angle that it would be impossible to measure with an ordinary protractor. A very practical way is to use two discs and an angle plate as shown in sketch especially if it is a repitition job. Calculating the size of the discs so that they will touch each other makes them much easier to set up. As no measuring is necessary after the size of the discs are known, it is convenient to use the standard one inch reference disc used for testing micrometers, and gives the correct answer.

WHEN IT DOES NOT PAY TO RISE TOO FAR

It is irksome not to advance rapidly. It tries one's patience. It makes one sometimes feel discouraged. But the events of the last eighteen months have brought home to many that it is dangerous to rise too far, especially in abnormal times. What has happened in a great many concerns is this: During the boom period promotions were made pretty rapidly. Things moved so quickly and money was being made so easily that promotions and salary increases were not always scrutinized with care.

Then disaster came. Boards of directors ordered drastic retrenchment. In many instances outside experts were called in to recommend reorganization of forces. Their investigations revealed that certain men were drawing big salaries for doing comparatively little work and that these men often were not of calibre warranting the salaries received. When heads began to fall, the heads of such men were the first to drop. In a great many cases, their places were taken by assistants or others who had not basked in the favor of any higher-ups and who were doing a lot of work for relatively little money.

If a list could be compiled of the dismissals during the last year of men drawing salaries of from $10,000 to $50,000 a year, it would create a tremendous sensation.

During this same period not a few able, industrious, conscientious fellows have moved upwards to fill the places of those who rose too rapidly and too far. The law of compensation may often seem to us to operate heartbreakingly slowly, but it does operate. It is safer to be paid less than one is worth than more than one is worth. That's a thought worth keeping in mind.—Forbes Magazine.

AN ELECTRIC SOOT RECORDER

Information was published recently regarding an interesting instrument for recording the amount of smoke suspended in the air from hour to hour. In this machine a fixed quantity of air was drawn through a piece of wet filter paper which was stained to a greater or lesser degree by the impurities in the air. Another instrument has been devised in Brtain for a similar purpose, and it operates on an electrical principle. It consists of a covered dish containing a small quantity of electrified water over which the air to be tested is passed. By proper adjustment of the rate of flow of the air all the acids in the air are dissolved in the water and the solid particles fall into it. The proportion of acid can be readily estimated by chemical means and the solid impurities make themselves known by changes in the electrical resistance of the water. The advantage of this appliance is that it indicates the amount of acid in the air as well as the amount of smoke. This is an important point as the proportion of acid has a great deal to do with the harmful effect of air upon stone and other structures.

Typical Applications of Ball and Roller Bearing

Continuation of Article Which Appeared in November 10th Issue —Polishing Spindle Application—Worm Gearing Arrangement —Lathe Application—Also Automobile Gear Box Method of Mounting

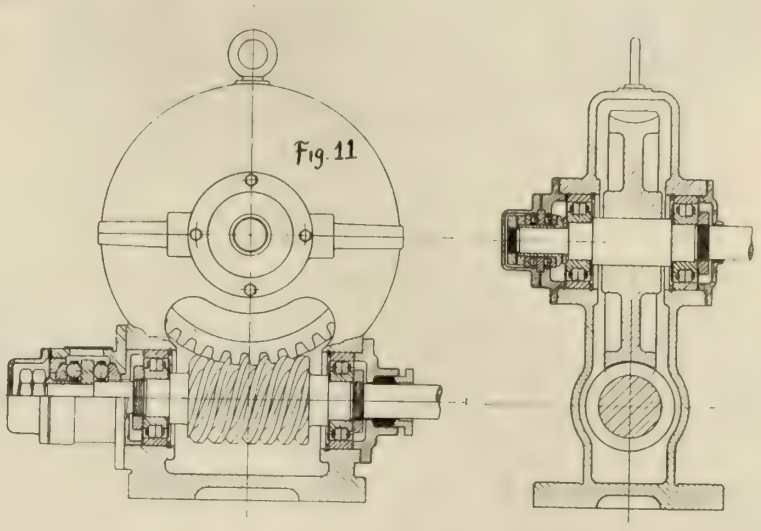
*By O. H. WILLISON

IN THE Nov. 10th issue of Canadian Machinery, the first portion of the present article was published. Since that time we have received a criticism to the article, and in order that readers get a chance to hear both sides of the question, we are publishing the criticism on another page of this issue.

Mr. Willison's article was complete in itself, but owing to its extreme length we broke it up into two parts. This being so, we now publish the remainder of his material.

In Figure 9, this cut being shown in the last portion, we showed a ball bearing pulley design where the pulley is mounted on the end of a shaft. It differs from Figure 8, the previous application only in that one bearing is clamped against the shoulder of a parallel sleeve, which in turn is clamped against a shoulder machined on the shaft. The other bearing is made a push fit on the shaft, and must be free sideways so that it can align itself opposite its outer race. Most of us, at one time or another, have had occasion to enter factories where polishing or buffing machines are in use, and almost always have we noticed the excessive vibration which exists where the machines have been in operation for any length of time. This is usually due to the sleeve type bearing having become worn and the shaft chattering in consequence.

*Bearings Engineer with Lyman Tube and Supply Co., Montreal.



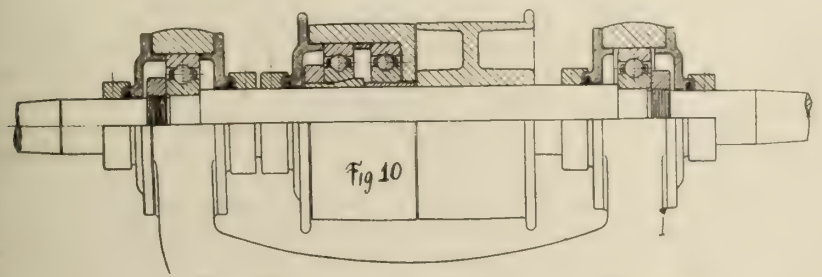


Fig. 11.—A worm gear application

Figure 10 illustrates a ball bearing application to a polishing spindle. It will be noticed also that, in addition to the spindle bearings, the loose pulley is mounted on ball bearings. Like all other applications, one bearing is locked endways to locate the spindle and to take any end thrust that may be put upon it. The outer races of both bearings should be a nice push fit in the housing. They must not be slack, but must have sufficient freedom to permit of the outer race of the free bearing aligning itself opposite its inner member. The success of a machine of this type depends largely upon keeping dust out of the housings. It is very necessary, therefore, that ample means are provided for this. Flanges are attached to the shaft close up to the housing, and, in addition to the shallow grease grooves, a felt washer should be used. If these precautions are taken, all trouble can be eliminated and a thoroughly satisfactory and vibrationless spindle produced. The loose pulley is exactly as shown in Figure 8.

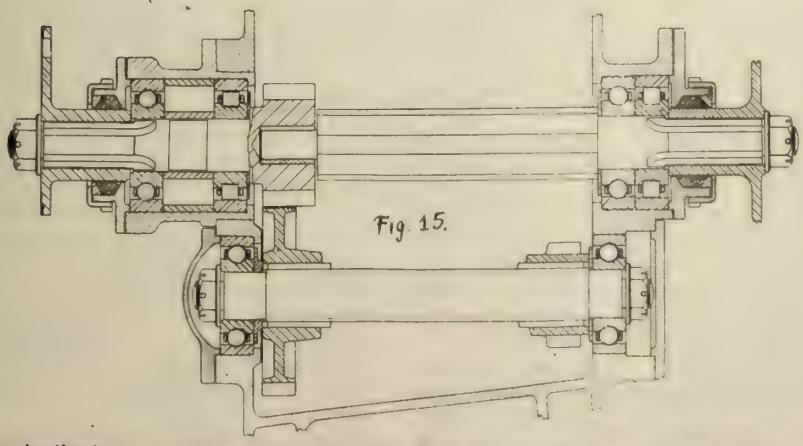

Fig. 10—Application to polishing spindle. Fig. 15—Method adopted for heavier type of touring car.

Figure 11 illustrates the application of anti-friction bearings to worm gearing. Where the loads are exceptionally heavy, the worm shaft is carried on two roller bearings, and the end thrust taken by a double thrust bearing unit, this being complete with housing ready to bolt to the frame. The worm wheel is similarly supported on roller journal bearings, but, as in this case the thrust is usually much lighter than on the worm shaft, it is common practice to locate the worm wheel by means of an ordinary double thrust washer. By the use of roller journal bearings on this work the diameter of the housings can be kept reasonably small without endangering the efficiency of the unit as a whole. Gearing mounted in this way reaches its maximum efficiency, and since there is

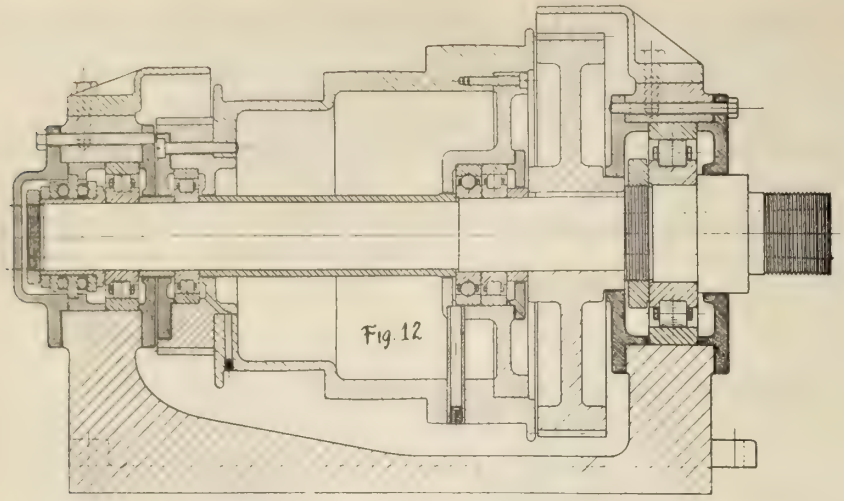

Fig. 12.—Showing a lathe application.

no wear in ball and roller bearings under proper conditions, this condition is maintained indefinitely. The absence of wear in the bearings reduces to a considerable extent the tendency for wear in the gearing itself.

In so far as the mounting of the bearing is concerned, it will be noted that the inner races of the journal bearings are a tight press fit on the shaft and held in position against shoulders on the shaft by means of lock nuts, care being taken that the nut does not bear against the race to a greater diameter than the bottom of the roller tracks. Between the shoulders on the shaft and inner race of the bearing a thin steel washer is shown. The outside diameter of this washer should be slightly smaller than the bore of the outer race of the bearing. This will keep the bearings free from any fine particles of metal which may find their way into the grease from the worm or worm wheel teeth.

The outer races of the roller journal bearings should be a tight fit in the housings, and are held endways by means of spigots on the end covers and split rings, rectangular in section and let into a suitable groove in the housing. The housing of the double thrust bearing on the worm shaft must be held both square and concentric with the bore of the housing provided for the journal bearings. Neither this nor the accurate machining of the shoulder securing the centre race of the double thrust bearing presents any difficulty, however. The end cap on the double thrust bearing completely encloses the end of the worm. A packing gland is usually provided on the other end of this worm shaft, thus preventing the leakage of any oil or grease from the worm casing.

The sleeves of the thrust bearing on the worm wheel should be a nice push fit on the shaft and clamped firmly against the shoulder by means of a lock nut. The same care must be taken to ensure the centre race being held perfectly square with the shaft. The thrust bearing end may be capped off and the other end cover provided with very fine running clearance, about .01 in. A series of small grooves should be turned in the bore, but it is unnecessary to provide a packing gland in this case.

It is important to remember that when the halves of the worm wheel case are bolted together they must provide a perfectly cylindrical recess for the outer races of the roller bearings. Any inaccuracy is liable to distort the outer race of the bearing and cause local overload. It is usual to rely upon the oil contained in the gear case for lubricating the whole of the bearings, and, if the shields described above are fitted so as to protect the bearing from chips and dust, this is a very effective method of lubrication, and one that will give satisfactory service.

Lathe Application

Of particular interest will be found the application shown in Fig. 12. This illustrates a lathe spindle equipped with ball and roller bearings. Apart from the saving in power and freedom from lubrication trouble, the bearings offer considerable advantages on a lathe headstock. Where plain bearings are used, they commence to deteriorate from the day the machine is set to work, gradually showing more and more wear until work turned out by the machine is so unsatisfactory that it is essential to overhaul it and refit the bearings. Where roller journals are employed, however, there is no measurable wear over very long periods, and the machine after it has been running for many years is turning out as accurate work as on the day it was first started up. In view of the efficiency demanded from the modern machine tool, this advantage of accuracy maintained over indefinite periods cannot fail to result in an ever-increasing demand for the use of roller journal bearings on machine tool spindles.

While the cost of the bearings and their mounting is admittedly higher than the sleeve type, the saving effected in power, lubrication, overhauling, and the fact that accurate work can be done more quickly, should more than compensate for this. It is significant in this regard to mention that one of the largest manufacturers of turret lathes has recently placed a machine on the market having its spindle mounted on anti-friction bearings of this type. It will be seen from the drawing that the spindle is mounted on two roller journal bearings, a double thrust washer being provided to take the end thrust. The cone pulley is also mounted on roller journal bearings, but, as in this case the thrust is comparatively small, a ball location bearing is ample to take care of the load. The outer race of this location bearing is ground smaller on its outside diameter than the adjacent roller bearing. This prevents any radial load being placed upon it, enabling it to take the thrust load only.

The production of perfectly cylindrical work with highly polished surfaces, and the production of perfectly flat surfaces having a mirror finish, has been one of the greatest problems in the grinding machine industry. The selection of suitable grinding wheels and the operation of the machine at proper speeds, feeds, etc., is obviously of greatest importance. Equally so is it important that the spindle be mounted in such a way that vibration is entirely eliminated. The design illustrated in Fig. 13 shows an application of anti-friction bearings to this type of machine. The spindle runs in two roller journal bearings; the weight is supported and the end thrust taken on a double thrust washer. The same method of mounting the bearings must be adhered to as in all previous designs, and special precaution taken to prevent the intrusion into the housings of particles of dust or emery.

The driving pulley is carried on one roller and one ball journal bearing. These bearings are mounted on a sleeve which forms part of the frame of the machine, and there is accordingly no belt pull on the actual grinding spindle. Inasmuch as the outer races of the pulley bearings are the revolving members, they must be a tight fit in the housing, and both are held endways by means of a shoulder in the housing and a spigot in the end cover. The inner races are in this case a nice push fit on the sleeve, separated only by a distance piece, and clamped against a shoulder by means of a lock nut. This design makes for a very neat machine and one that has proven eminently satisfactory in use.

Ball bearings have been adopted as a matter of course in the gear boxes of automobiles, and their use is so general that further comment is unnecessary. An illustration, however, showing the standard practice as adopted by car manufacturers in England will surely be interesting on account of the wonderful records for reliability and long service established by these cars. Such names as Rolls Royce, Sunbeam, Vauxhall, Wolseley, and many others are by-words wherever automobiles are discussed, and it is significant to point out that ball

bearings and the short roller type of bearings described above are standard equipment with by far the greater majority of car builders in that country.

It will be noted by reference to Fig. 14, which is a design suitable for a light car, that the engine shaft is carried on one ball and one roller journal bearing. The propeller shaft is supported at its large end by a substantial ball bearing The small spigot bearing is of bronze, but in cases where the gear wheel at the end of the engine shaft is large enough, a roller journal bearing can be used. The lay shaft is carried in two ball journal bearings. It is recommended that as small chips from the gears are liable to damage the bearings, thin metal shields be fitted between the inner race and the shoulders against which they are clamped. The shields should be of a diameter that will enable them to just clear the bore of the outer race of the bearing.

Fig. 15 shows the method adopted in the heavier type of touring cars. It will be noticed here that in addition to the ball and roller bearings used on the engine shaft, they are installed on the outer end of the first motion shaft. The former, however, is a "location" bearing exactly similar to the others described in this article. The method of mounting the bearings is the same as in all the previous applications. The application of antifriction bearings to high speed woodworking machinery has attracted the attention of most high grade manufacturers, and they have achieved some startling results. One of the most notable achievements is in vertical shears, and these are now being run satisfactorily at speeds hitherto thought impossible; in same cases, 10,000 to 12,000 r.p.m. being the standard practice. A suitable application will be found in Fig. 16. Two roller journal bearings are mounted in the housing next the cutter and one in the lower housing. The weight of the spindle and any thrust there may be is taken on a ball location bearing placed at the bottom of the lower housing.

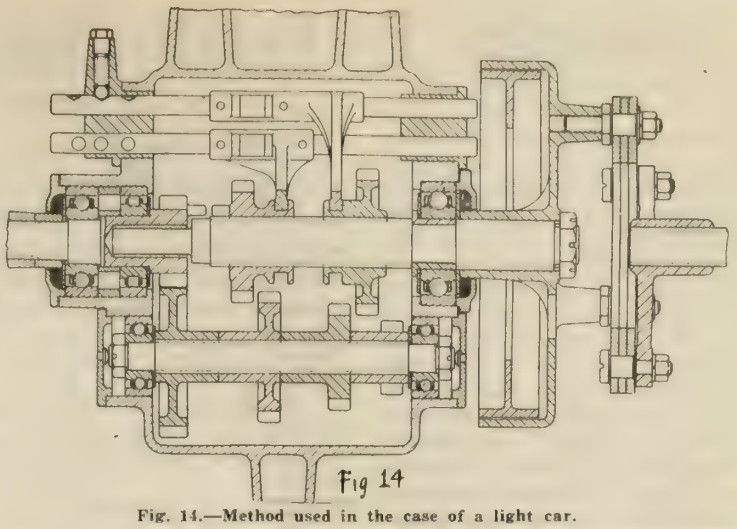

Fig. 14.—Method used in the case of a light car.

As is well known, the slightest vibration in the bearings of a moulding spindle results in unsatisfactory work. The complete absence of wear in the roller journal bearings is accordingly a very great advantage, ensuring the quality of work turned out over long periods without any attention whatever to the bearings. In order to ensure perfect alignment, it is assumed that the housings carrying the bearings will be cast solid with the slide and bored out at one setting. Rigid type bearings are strongly recommended.

It is hoped that the designs given above will prove helpful to those who are responsible for designing any class of machinery. Naturally, no attempt has been made to give shaft or bearing dimensions, as these must vary with each individual application. Nevertheless they outline what is necessary for successful operation, and, if followed in a general way, attention being paid to the remarks concerning the nature of the loads, etc., mentioned in the article, the results will be entirely satisfactory.

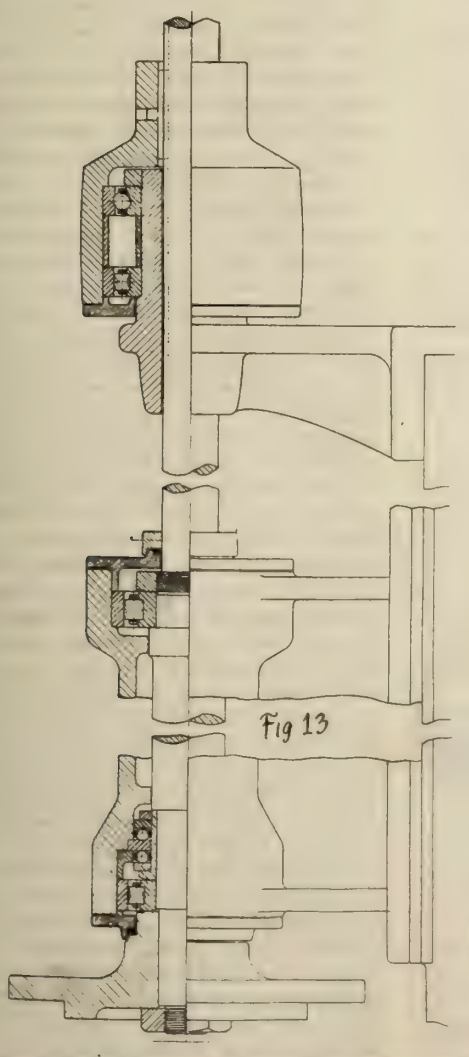

Fig. 13.—Method of applying to vertical grinder spindle.

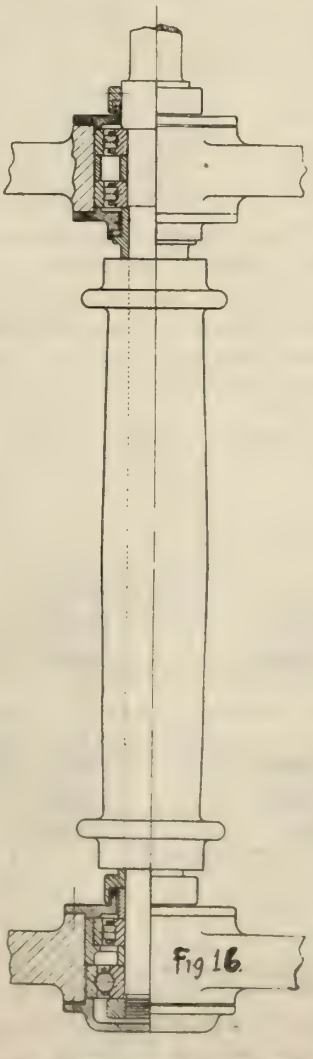

Fig. 16.—A vertical shaper application.

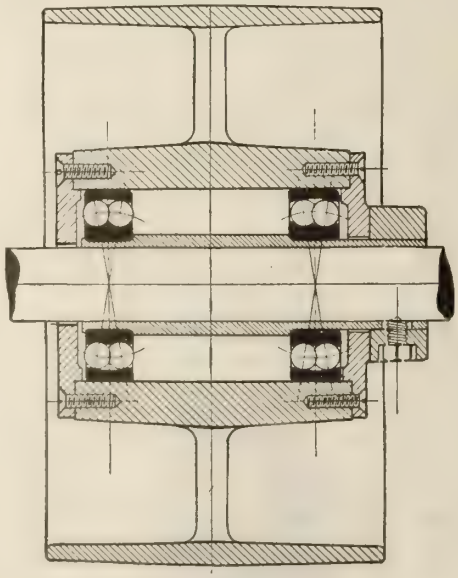
The Westinghouse Electric & Mfg. Co., has issued leaflet 1732, which describes and illustrates enclosed float switches. These float switches are used on motor operation pumps, to automatically maintain a water level in open tank, reservoir or pump system, and to prevent the water from rising above a pre-determined level. Electric motor drive for power pumps is the title of leaflet 1950, which is being distributed by the same company. This leaflet gives a discussion of the advantages of the use of electricity for this work, and it specifically points out the type of motor which should be used.

Criticism To Recent Ball Bearing Article

*By G. C. HEWSON

AFTER reading an article published in the Nov. 10th issue of "Canadian Machinery" under the caption "Typical Applications of Ball and Roller Bearings," the writer feels it his duty to call to the attention of the readers of this journal, statements therein, which are not in accordance with accepted theory or practice. This is done, not in any spirit of intolerance; but purely for the purpose of disseminating accurate technical information in this important branch of modern engineering development; because very little reliable information of value on ball bearings is to be found in the engineering or text books; and those interested must depend on the bearing manufacturers for exact data.



In the article just mentioned in the first paragraph on page 27, the following statement is made: "Unfortunately, however, this design limits the number of balls to those that can be put in by placing the races eccentrically. More balls can be inserted by use of a transverse filling slot, but this weakens the race and the balls are liable to be damaged if great care is not taken when they are inserted. The greater number of balls that can be used by this method, if carefully carried off, should, however, more than compensate for the somewhat weaker race."

The fallacy of this contention is readily seen, however, when a logical analysis of the problem is made. The weakest part of an annular ball bearing is the inner ring, for the following reason. The diameter of the inner raceway is smaller than that of the outer raceway by twice the diameter of the balls. This results in a sharper curve of the raceway of the inner ring — that is a greater convexity—in a plane perpendicular to the axis of the shaft. Therefore, when the ball flattens out under load, its area of contact on the inner raceway will be less than on the outer raceway, and since the load on both areas is the same, the pressure per unit of area will be greater on the inner race. Now if this race is weakened by the introduction of a filling slot, it is not difficult to realize that its carrying capacity may be exceeded by that of the balls and that therefore any additional balls inserted cannot increase the capacity of the bearing as a whole, since a chain is only as strong as its weakest link. Incidentally, also, all troubles due to interference between balls and filling opening are done away with in a bearing of the uninterrupted groove or no-gap type. The few tests given below of unbroken groove bearings and others with a greater number of balls will confirm the statements just made.

Two Col Table

Bearing	No. and size of balls
H. B.	8-9-16 in.

63¾ hrs.	With filling opening

The rated steady load of the first bearing is given as 890 pounds at 1445 R.P.M. In these tests a load of 2,500 pounds at 1445 R.P.M. was employed in order to bring about quick results, since the number of hours run before failure occurs is all that is needed for comparative purposes, and gives a true indication of the relative endurance of the bearings.

Showing the patented method of mounting a loose pulley on ball bearings.

Metal'urgy and Heat Treatment.

The next paragraph in the same column of the article in question deals with the steel used and its proper treatment. The statement is made that —"a suitable mild steel properly carburized is the most suitable for the races and that the difficulty with a chrome-carbon steel is in obtaining a uniformly hard race." The writer is prevented by lack of space from going into the metallurgy and heat treatment of ball bearing steel in detail, but a general outline of the situation may be given.

Steel obtains its hardness, partly through a high carbon content, and partly through hardening. It is impossible, however, to harden pure carbon steel uniformly throughout, except in pieces of small size. Since alloy steel of suitable composition permits of uniform hardness throughout, good ball bearings are made of hardened alloy steel, generally containing chromium and with a high carbon content. This steel is glass hard after hardening and is, therefore, subjected to a moderate drawing process, which removes the stresses set up during quenching and increases the toughness without materially decreasing the hardness of the material. This toughness is required to prevent fracture under shock loads. The great secret lies in obtaining in the beginning a steel as free as possible from impurities. The carburizing or case-hardening method mentioned in the article in question is a cheaper and commoner method, but, in practice, is inferior to a high carbon alloy steel, which is hardened throughout.

Capacity Affected by the Kind of Load

In the middle paragraph of the second column on page 27 the statement is made that "when pearings are mounted in a substantial housing on a rigid base plate bolted to a solid cement foundation the effect on the bearing is more severe than when the load is imposed by gearing or some spring method." The fact is, that bearings subjected to loads imposed by gears, especially straight spur gears, are operating under one of the worst conditions and a factor of 5 or 6 is generally used in calculating the size of bearing required. This means that the shock imposed on the bearings by the action of the gears brings the equivalent loading up to about 5 or 6 times the value of the normal steady load due to the

*Author is bearings engineer for the S.K.F. Co. at Toronto.

power being transmitted. In chain transmission the factors used vary from 1 or 1.5 with silent type chains up to 3 or 4 with anchor type chains.

The example given by the writer of the article under review is, in my opinion, even further wrong than his statement of operating conditions. He says that in selecting a bearing to take the thrust of an aeroplane propellor, one was satisfactorily used that was much smaller than was apparently justified by the rated load. This is quite true, but not so the reason he gives, which is, that "in an aeroplane the shocks and stresses are dissipated through the various parts of the machine." The real reason for the satisfactory service of the smaller bearings is that the life of the aeroplane power plant is distinctly limited, in fact, is only a few hundred hours—and that therefore a bearing which is capable of standing up to the conditions of service for the same number of hours is all that is necessary. This is equivalent to overloading the bearing deliberately for the time mentioned and the shorter the life required of the bearing the more it can be overloaded. That is, the overloading and the life vary in an inverse ratio. This idea is carried out in motor car and motor truck design where in some cases bearings are overloaded 100 per cent. because even then, the bearing, with proper care and attention, will outlast the life of the car itself.

Applications

Among the so-called practical applications are shown in figs. 8 and 9, page 28, two methods of mounting ball bearings in loose pulleys, both of which are anything but practical. In fig. 8 a special sleeve and an adapter sleeve are required, the special sleeve being accurately machined to fit the shaft and the bore of the bearing. This special sleeve must also be of exactly the right length to occupy the space between the adapter sleeve and the end of the hub of the tight pulley. This makes every loose pulley a special job, to fit the tight pulley it is to work with, and means that it cannot be interchanged with another pulley without altering the length of the sleeve. Also to install or remove this pulley it is necessary to take off the end cap before reaching the locking nut. When the hub of the pulley is thus left open during installation there is great danger of the intrusion of grit and other foreign matter which would quickly bring about the destruction of the bearings. If it be found necessary to remove this pulley after it has been in operation for a time, the end cap would have first to be taken off and the grease removed—a dirty operation at best.

The pulley application shown in fig. 9, is even more impractical than that shown in fig. 8, since it requires considerable machine work being done on the shaft. The shaft must, first, be accurately turned to the bearing bore, a shoulder must then be turned, and, finally, the end of the shaft threaded. A special sleeve is also required machined to fit the shaft and bearing. The whole assembly is locked together by means of a nut on the threaded shaft. Besides the considerable machine work necessary, this application is open to the same objections as the application in fig. 8, namely, the necessity for removing the end cap in order to reach the nut when mounting or taking off this pulley. The bearing which is mounted directly on the shaft is not locked to it in any way and if a perfect fit be not secured, (and possibly even if it be secured) the bearing will commence to creep, peen down the shaft, and eventually destroy itself. The only practical way of mounting ball bearings in a loose pulley is the patented application shown in the cut, fig. "A." In this way the pulley is secured by the purchaser as a unit and he can install it in five minutes by simply slipping it on the shaft and tightening up the set screw in the end collar. It is interchangeable and can be used on any piece of cold rolled shafting of the same nominal diameter. Moreover the objectionable feature of having to remove the end cap is entirely eliminated as these can be closed by the manufacturer without the necessity of ever re-opening them.

The application shown in fig. 7 is quite correct mechanically, but far more expensive than necessary. The fairly large cost of the double thrust bearing can be eliminated by using a roller bearing that will carry an axial thrust load in addition to its radial load. The writer has not, by any means, dealt with every point that could have been criticized but feels that enough has been said to call readers' attention, to what he considers incorrect ideas with regard to the use of ball bearings.

TIDAL RESEARCH WORK IN EASTERN CANADA

Have you ever had occasion to refer to tide table? Did it ever occur to you how this advance information is compiled?

The general public are unacquainted with the method of obtaining information concerning tides. The system of reducing the tidal observations is complicated and technical. The usefulness of the survey can, therefore, best be judged from the published results as shown in the annual tide tables issued by the Naval Department. These tide tables give the time of the rise and fall of the tide or the turn of currents along the Canadian coasts for periods of one year in advance; that is, the time of the tides for 1922 may be obtained from the tide tables issued in the fall of 1921. The tide tables also give for various regions the height of the tide and the depth over certain areas at high and low water. The information is valuable to shipping interests as they are enabled to know the depth of water over bars and shoals at the entrances of our harbors at any stated period. The information compiled by this survey is also useful with regard to mean sea level which is determined by them and which is used by land surveys as the basis of their levelling operations.

The record of tides is obtained by use of an ingenious instrument actuated by clockwork. This instrument gives a continuous curve which shows the height of the tide at every moment throughout the day and night, and thus records more accurate information than could be obtained by three men set to observe the tide in eight-hour shifts during the 24 hours of each day. These instruments, to give correct results, must be carefully installed and must also be kept accurately set.

The tidal records complied by the Canadian Government have now reached a high standard of perfection and Canada is well in the lead in recognizing the importance of tidal information not only for navigation purpose but also as a basis for carrying out levelling operations and survey work on land.

Extensive tidal research work has been carried on by the tidal survey branch of the Naval Department during the past summer. This work was performed in order to obtain additional tidal data over that compiled in previous years for our harbors and various other areas for which tidal information is required.

During the past year observations of the tide were made at Campbellton and Dalhousie at the head of Chaleurs Bay and other habors in eastern New Brunswick, where the tide is of special importance because of bars at their entrances. At these harbors, considerable dredging has been done, or is in prospect. Tidal data are essential in relation to low-water levels and the amount of rise of tide where the depth of water available for navigation is limited. The tidal data will facilitate the determination of what amount of dredging is necessary.

Three new tidal stations were put in operation at the entrance to the St. Lawrence, i.e., at Gaspe, Fox River and Seven Islands. Tidal data were also obtained for the east coast of Hudson Bay and for James Bay. In addition to the special work undertaken, the six permanent tide stations on the east coast have been continued and from the reduction of the records obtained will be compiled tide tables for future years.

The Universal Knitting Co., Vancouver, B. C., has in the past twelve months doubled its floor space and doubled its capacity, and according to the manager, is employing more operators than ever before. Full time has been worked all the year. The volume of garments manufactured and sold has been 50% greater than last year.

What To Do, And Avoid, During Business Cycles

The Ideal or Normal State Never Did Exist—Business Always Moves in a Ceaseless Ebb and Flow—Business Should Be Handled as If We Were Piloting a Ship

By Chas. L. Cameron

"WHAT should machine tool builders do, and what should they avoid during the various stages of business cycles?" This was the interesting subject which Charles L. Cameron of the Gould & Eberhardt Co., Newark, N. J. discoursed on during the annual convention of the National Machine Tool Builders' Association at New York, but let Mr. Cameron speak for himself.

"We frequently discuss normal business in the sense that at some time everything runs along smoothly—nothing to disturb us and orders plentiful. When orders fall off, we hear complaints that the situation is abnormal. If material prices are high," said Mr. Cameron, "or selling prices low, it is abnormal; if money is tight with high interest rates, we consider it abnormal. If wages are high and labor productively low, the manufacturer thinks it is abnormal. If wages are low, and the boss is insisting on getting a full day's output, then the workman fee's that he is 'out of luck.'

"A student of economics finds that the ideal or normal state never did exist. Going into it more deeply, he finds business always moving in a ceaseless ebb and flow, now at high tide and now at low—never the same—and he concludes that like the ocean, the only normal thing about business is its continual change, its tides rising and lowering, while its waves, storms and calms play on the surface. Business cycles, that is, depression alternating with prosperity, are the only normal—a state of rest would be abnormal. Therefore we must learn to study and handle our business as if we were piloting a ship, with the knowledge of an efficient seaman who knows the dangerous tides, and who constantly studies his barometer to know whether it is going to be fair weather or foul, and who eventually brings his vessel safely to port.

The Four Cycles

"Briefly, there are four cycles in business — prosperity, liquidation, readjustment and improvement. Reliable understanding of what should be done and what should be avoided during these periods is the foundation on which business can be successfully conducted. There has been a preponderance of statistics gathered and published in the last months in an endeavor to explain and analyze the causes of the depression through which we are passing. Statistics or barometer charts of any kind are like a feather. They blow this way and that, and really only show the direction of the wind. Do we ever stop to reason why the wind blows, or why it does not blow? Similarly in business—we know it is good, or we know it is poor, and we try to fathom the cause. It seems to me, however, that we do not go deeply enough into the underlying fundamental causes. It is a very deep subject, and while many students draw comparisons with experiences after great disturbances such as long wars, or catastrophes such as earthquakes, we never find exact parallels. There are, however, a great many indications and experiences during these four cycles, which if we would only be impressed with them as they are occurring, would help us greatly.

"It is very plain that the cycles cannot be understood unless one appreciates that the business man starts a business, not to produce or sell goods as such, but to make a profitable income through the production or sale of the goods. In making this profit credit is used more and more, with the result that the cycles are really financial or credit cycles rather than production or sales cycles. In the present state of depression, most industries have passed through the period of liquidation. Probably the iron, steel and machine tool industries are behind many others in this respect, as it is quite apparent that there is still further liquidation to be anticipated. But the general feeling and statistics show that business as a whole has passed through the period of readjustment, and is now starting in the cycle of improvement. I will briefly refer to the cycles, commencing with improvement, followed in turn by prosperity, liquidation, and readjustment.

"I feel it is unnecessary to dwell at length on any of the cycles with the exception of prosperity, as it is there that our danger lies. At the beginning of a period or cycles of improvement the level of prices is low, drastic reductions have been made in costs. Profits are at a very narrow margin, there are liberal bank reserves, and there is a conservation in the valuation of business enterprises, and a conservation in the policy of granting credits.

"A great deal of cash buying is experienced. Business under these conditions will begin to revive slowly at first, but as one industry becomes more active, it in turn affects many others, and so on until there is a general turn from idleness into activity. These changes, as a rule, come about slowly unless some important event such as unusual harvests, active purchases by the Government or marked increase in export demand causes a more rapid expansion.

Cycle of Prosperity

"We now approach the cycle of prosperity, and the very processes which have been working one on the other to enhance prosperity are slowly creating an accumulation of strains that ultimately undermine the foundation on which prosperity rests. Let us see what happens in the period of prosperity; our plants have all the business they can handle with standard equipment. Contracts for material ordered during the period of improvement have expired; renewals must be made at higher prices. Salaries are increased. Prime costs are rising at a rapid rate. Inadequate equipment is brought into operation. Everybody is bidding for labor. As this goes on, the general efficiency of labor declines. Undesirable help gets into our plants, and we find it more difficult to obtain efficient executives. Prices of raw material rise faster than the selling prices of products, and right here we have a serious problem. Our selling organizations are crowding us with orders. We soon accumulate a tremendous volume of unfilled orders representing frequently several months' output. Due to the difficulty of obtaining deliveries of materials, we must anticipate and schedule our requirements frequently seven to eight months in advance. We are conservative in increasing the prices of our finished product, with the result that when the product has been on order for months, and is finally completed and shipped our costs have risen so greatly that what slight increases may have been made were not adequate with the rapid rise that has taken place.

"It would seem to me when our deliveries are so far off, that if some plan could be worked out whereby we could sell our product on the basis of cost at the time of completion, we would be in a much more equitable position. This was tried for a short period during the war, but there were not many of us taking orders under these conditions. As prosperity continues, the demand for bank loans grows rapidly, not only with the larger volume of trade, but also with the rise of prices, and the desire of business men to use their own funds for their own business. Additional loads are added to our banking system. The rates of interest then become very high, and check the expansion of the volume of trade out of which this period of prosperity has developed. Many ventures are postponed. The permanency of various business enterprises is analyzed very carefully by the banks. As costs and prices become so high, new enterprises defer execution of many plans for a more advantageous time. We find that orders for future delivery are falling off. Again we face a difficult situation, for the reason that we still have on our books many months of unfilled

orders, and we are now approaching the most dangerous period in any of the business cycles. It is at this time that we should set our storm signals. We have been going along optimistically, and it is hard for us to realize that at a time like this we should begin to 'watch our step.' It is at this time we should be unusually careful.

"Not long ago I heard of a very wealthy man who made a practice of investing his money in industrial plants, but he stated that he made it a rule never to invest in a one-man concern; yet he would never put his money in a concern that did not have a 'one man.' It is this 'one man' in our organization who must have a clear vision. We attend functions where frequently prominent people tell us in most optimistic phrases of continued prosperity and similar encouragements, but we must not allow ourselves to be misled. We must realize that the limit has been reached in the period of prosperity—in fact there should be a feeling in our bones that we have reached this limit.

"Our first thoughts should be to curtail our contracts for high-priced material. It may be difficult to do this, but it would be far more profitable to buy almost from hand to mouth at the higher prices to take care of the unfilled orders that we have, than to contract for a large quantity of high-priced material, and have it on our shelves for months after our prosperity has left us, and which we must work up and sell at a loss. There are a number of indications that are apparent at this time which we must learn to recognize as they occur.

"Prosperity thus ultimately brings on conditions which start the liquidation of large stocks which have piled up; this liquidation merges into a crisis. Again we may say to the 'one man' — know thyself! It is by his direction that unnecessary expenses of all kinds are curtailed. We have now reached the period of liquidation, and passing through this we come to the period of readjustment. As these periods are so fresh in our minds it is unnecessary for me to say what the machine tool builders should have done or should have avoided. If we had known as much a year ago, as we know today, no one would now have to tell us what we should have done."

LAUNCH OF S.S. KUTSANG

On the 19th October there was launched from the Wallsend Shipyard of Messrs. Swan, Hunter & Wigham Richardson, Ltd., the Katsang, a single screw ship to carrry passengers and general cargo and to run in the service of the Indo-China Steam Navigation Co. of Hong Kong and London. Messrs. Swan, Hunter & Wigham Richardson have already built a number of ships for these owners. "Increase in Luck" is the meaning of Kutsang, which name was bestowed upon the ship by Mrs. Keswick, the wife of Major Henry Keswick of Cowhill Tower, Dumfries, as the vessel left the ways in the presence of a large company of visitors.

The Kutsang has an overall length of 434 feet, a moulded breadth of 54 feet, a depth of 31 feet, and will carry 7,000 tons deadweight on a draft of 25 1-2 feet. She has been built to Lloyd's highest class, and has a poop, a long bridge amidships, and a full topgallant fore-castle. On the boat deck there are comfortable quarters for the captain, a smoke room, and a ladies' room. On the bridge deck, on either side of the engine casing are cabins for the officers and engineers, and forward of the funnel are staterooms for first class passengers and the dining saloons. In the poop is accommodation for the second class passengers and above the steering-gear house is an hospital and dispensary. The sailors and firemen have their quarters in the f recastle, the petty officers and apprentice boys being housed on the upper deck on either side of the mail and baggage compartments beneath the first class dining saloon. Refrigerating machinery will be installed to keep meat and other perishable provisions in good condition.

In most of the cellular double bottom of the ship, oil fuel can be carried as well as water ballast. The machinery and boilers of the Kutsang have been built by the Wallsend Slipway & Engineering Co. The main engines are of the four-cylinder quadruple expansion type, balanced on the famous Yarrow, Schlick and Tweedy system. There are four single-ended, cylindrical boilers with a working pressure of 220 lbs per square inch under forced draft.

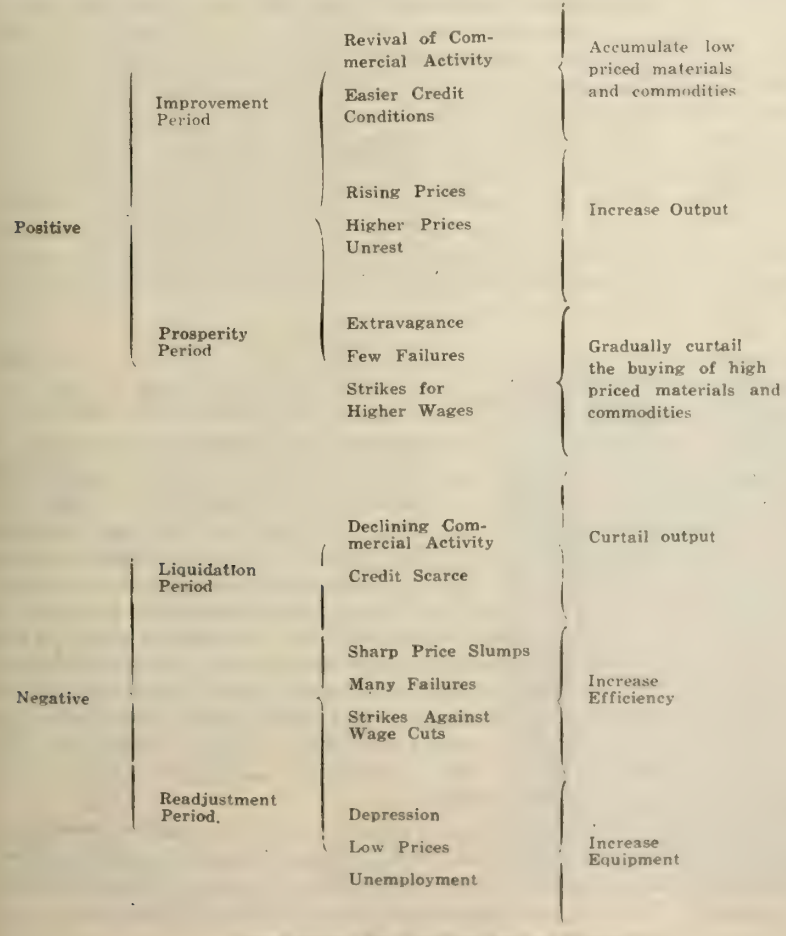

Chart Shows the Author's Idea of Grouping.

S.S. SERVICE TO BRITISH WEST INDIES

The Canadian Government is inviting tenders for a mail, passenger, and freight service between Canada, the British West Indies, and British Guiana. These tenders will be received at the office of the Deputy Minister of Trade, Ottawa, up to January 31st, 1922.

Tenders should be for weekly or fortnightly sailings from St. John, N. B., or Halifax, N.S., to the Bermudas, Barbadoes, Trinidad, and British Guiana, with calls at Grenada, St. Vincent, St. Lucia, and other places. Tenders also have the option of tendering for a weekly service with sailings alternately from St. John and Halifax. The length of time that the contract is expected to cover is from five to ten years. The steamers are to be from 5,000 tons to 6,000 tons gross, and must be able to maintain a speed of twelve knots an hour, provide accommodation for 100 first class, 30 second class, and 100 steerage passengers. In tendering it is requested that the amount of the subsidy required be stated. Other regulations state that there must be no unfair differentiation of rates of freight against the smaller as compared with the larger colonies, an that all freight and passenger rates are to be subject to the approval of the Minister of Trade.

Automobile Bodies of Zinc

ZINC sheets are now being used for many automobile parts, according to information received. In the No. 18 gauge and the heavier ones employed the metal possesses all the strength required, while the cost is decidedly less than that of aluminum. It also has the further recommendation that it does not rust and cause the enamel to chip off. In supplying large quantities of zinc for making hub caps and other parts of automobiles, a certain American zinc company realized the need of a joint different from the soldered type, which would possess as much, or more, strength than the metal and which could be polished smooth without losing any of its strength. After due consideration they made several successful experiments in zinc welding.

The edges of two sheets of zinc were cleaned bright and butt-welded, with a strip of the same material to fill in and give strength to the surface. Bending and tensile strength tests of the joint after it had been polished smooth showed that the two sheets were completely united, and that when thus joined together they were fully as strong at the point as at any other place. The work was done with the oxy-hydrogen flame of a lead-burner's outfit by two men, who, it is stated, were not especially expert either in soldering or in lead-burning.

Increasing Their Earning Power

A STEEL mill in Georgia was not getting along very well. Although their methods were up-to-date, the profits were too small to allow the existing rate of wages to continue. The owner of this plant, which was run on the open shop plan, decided a ten per cent. reduction in wages was necessary, so, not wishing to have trouble with the men, he asked that a delegation be sent to confer with him.

George F. Swetnam, who tells the story in a recent issue of Industrial Management, says that when this owner laid his case before the men and told them of his proposed action, they announced, after some deliberation, that they appreciated his courtesy and sympathized with him, but that in justice to their families and themselves they could not accept a reduction of more than five per cent. The owner then suggested a revision of wages on a piece-work schedule, and to this the men agreed.

Each man was furnished with a chart on which to put down the amount of work done each day. At the end of the day the charts were handed in to the gate-keeper, to be compared with his report of work done, and filed. In the six months since that time only one man has ever tried to cheat. He was caught, but given another chance, and has been straight ever since.

Records for the past six months show the following facts: Hours have been shortened; the average amount of work per man has increased twenty-five per cent.; wages have increased on an average of fifteen per cent, and the labor turnover has been strikingly small.

A Sliding Bumper

ANY device which makes for safety is always welcome. Geo. F. Paul describes in Scientific American a new bumper that has been perfected and which is said to eliminate many of the dangers met with in the use of a rigid bumper for railroad cars. The one main advantage with the new bumper is that, when moving cars into track, the instant the first car strikes the shoes the whole crew knows it and they all realize that they are coming to the end of the track, and it is the engineer's duty to stop, whereas, in the case of a rigid bumper, the first notification the crew has that the cars are at the end of the track is a sudden jolt, and with the coming of this jolt the damage has been done. With the use of most types of rigid posts there is always a possibility of injuring the post or displacing the track.

This bumper is designed to be used on the blind end of a track. The sliding shoe catches the car wheel and is forced along the rail, creating a very high friction which effectively retards the momentum of the car wheel within a rail length.

Is It Quality or Application

AT a recent meeting of the American Chemical Society, in the division of dye chemistry, Dr. J. Merritt Matthews stated that, in his opinion, the fast colors of antiquity were not so much due to the better dyes employed, but that in the application of these dyes a great deal more care was exercised and a great deal more time taken. In the discussion which followed it was pointed out that advances in economy in the application of dyes can easily be accompanied by a deterioration in quality. This emphasizes the point often made that American-made dyes themselves are not so much open to criticism as methods used in their application. It has been pointed out also that methods are not apt to improve under present conditions when the price of fuel is such as to tend to shorten every process where heat is employed, such as, for example, the proper steaming of printed goods following the application of dye.

Making Up For A Poor Memory

ONE of the best executives I have ever known started out in a very small way and in a very small business, and seemed to have all the ends of the business in hand. This man, continues B. R. Duncan in System, lacked but one qualification to make a perfect executive—namely, a good memory. He made up for this by being a great believer in the memorandum system, and in placing everything where he would see it before it should be attended to. This man is now in a very large establishment and he seems to have mastered the details of every portion of the business. Added to his qualifications for an executive was the fact that he had a wonderful mind for thinking out things far ahead of anyone around him. The result was that in a cumulative way he did splendid work and is doing it to-day.

He has a thorough knowledge of practically everything in the business. This, to my mind, makes a good executive—not a knowledge of just certain sections of one's business. To be a good executive one must be broad, and ahead of the procession—not in back of it.

WHAT OUR READERS THINK AND DO

ANSWER TO CRITICISM

By Cecil H. Smith

In the Nov. 24th issue of Canadian Machinery, Mr. Davis gave his viewpoint on a former article on threading written by the author. I have read his article with interest, but frankly I cannot understand his viewpoint. In the following matter I am going to give solutions to his problems as best I can.

To my mind, when a pitch of thread is given as a decimal, it would be quite proper to also designate the lead screw pitch in decimals. For example:—

$$\frac{.654 \text{ screw to be cut.}}{.333 \text{ lead screw}}$$

By cancellation we get zero as follows:

$$\frac{.654}{.333} = \frac{218}{111} = \frac{109}{111} \times \left(\frac{2}{1} \times \frac{20}{20}\right) = \frac{109}{111} \times \frac{40}{20}$$

This makes a slight error in lead.

Mr. Davis' method would be:—

$$\frac{654}{1000} \times \frac{3}{1} = \frac{1962}{1000} \div \frac{2}{1} = \frac{981 \text{ driven}}{500 \text{ driven}}$$

Now the question is—"where do we go from here?"

I have had over nineteen years' experience in the machine shop, but I never, as yet, heard of a lathe with a lead screw three threads per inch. Nor have I seen or heard of a drawing which gave the pitch of a thread as 3 2-3 in 1 3-4 in. Further I cannot see why a thread should be cut to a pitch of .654 in. Mr. Davis mentions that my method may be all right for the common threads usually found in a machine shop. As this is what I use it for, I am perfectly satisfied. A word about metric pitches.

On Page 875, fourth edition Machinery handbook is the following rule, and which is on the principle of the one I gave: "Suppose a thread of 3 millimeters lead is to be cut in a lathe having an English lead screw, and a screw constant of 6. As there are 25.4 m.m. per in., the number of threads per inch will equal

$$\frac{25.4}{3}$$

Place the screw constant as the numerator and the number of threads to be cut as the denominator, and we have:—

$$\frac{6}{\frac{25.4}{3}} = 6 \div \frac{25.4}{3} = \frac{6 \times 3}{25.4}$$

The numerator and denominator of this fractional expression of the change gear ratio is next multiplied by some trial number to determine the size of the gears. The first whole number by which 25 can be multiplied so as to get a whole number as the result is 5. Thus 25.4 x 5 = 127. Hence, one gear having 127 teeth is always used when cutting metric threads with an English lead screw. The other gear required in this case has 90 teeth. Thus:—

$$\frac{6 \times 3 \times 5}{25.4 \times 5} = \frac{90}{127}$$

Rule: Take number of threads per inch in lead screw by the lead of required thread in millimeters x 5 as the numerator of the fraction, and 127 as the denominator. The product of the numbers in the numerator equals the number of teeth for the spindle stud gear, and 127 is the number of teeth for the lead screw gear.

INCREASING UTILITY OF MILLING MACHINES

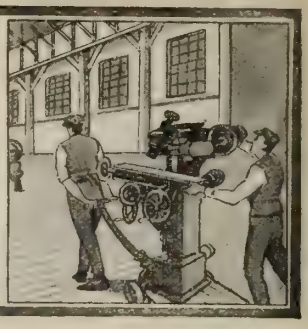
(By J. H. Rodgers)

The slotting of locomotive connecting rod ends in a Montreal railway shop, which formerly required three to four hours to accomplish—the work being performed on a slotting machine—is now done in about one-sixth the time on a universal miller.

When the job was first turned over to the miller it was necessary to drill two large holes through the inner end of the rod jaw, as the distance between the arm and the cutter spindle would not permit of a saw sufficiently larger in diameter to make the complete cut. It was subsequently decided to alter the shape of the arm so that larger saws could be used to cut out the piece by drilling the one clearance hole only at the inner end of the fork.

The design of the modified arm can be clearly seen by the accompanying illustration. The arm was made with an offset that provided ample clearance for the two large Huther saws, which were secured to the milling machine spindle in the usual manner. The time required for sawing is approximately 40 minutes. The jig is so designed that minimum time is required in setting up the work.

A POWER SAW ON A WHEELBARROW



A portable power-driven cross-cut saw exhibited by a British firm at a recent Agricultural show in England has many points of interest. It will do any kind of cross-cutting or cutting in the field or in the timber yard. A gasoline engine of four horse power is mounted on the shafts, which have handles at one end and a wheel at the other, wheelbarrow fashion. The light flywheel of the engine carries a small sprocket which drives a chain operating a large sprocket to which is attached the stroke arm of the connecting rod to the saw. Although this machine carries a 5 feet saw and can cut through a trunk 4 feet 6 inches in diameter, it can be wheeled about by one man. The whole outfit is self-contained, with tanks for water and fuel. Another feature is that the engine carries a small pulley from which farm or other machinery may be driven.

How the Locomotive Connecting Rods Were Slotted.

DEVELOPMENTS IN SHOP EQUIPMENT

MULTIPLE SPINDLE DRILLING MACHINE

The Henry and Wright Mfg. Co. of Hartford, Conn. have developed a bench, multiple spindle drilling machine. It is known as their No. 0. The machine is equipped with ball bearings and has a two step pulley in each spindle and on the rear driving shaft. These pulleys give four speeds, with a maximum of 12,000 r. p. m. The machine will drive a 13/64 inch drill to capacity. The tension of the belt driving each spindle is spring adjusted according to size drill being used. The lower arm has a vertical adjustment of 6¾ inches, which with a feed range of 2½ inches, gives a maximum height of 7⅞″ from table to the nose of the chuck. Spindles are all equipped with a special spring return. This spring prevents the breaking of drills when drilling of a piece is completed. The machine is equipped with a tight and loose pulley and a belt shifter.

Special attention in design has been given to rigidity as all parts must be perfectly in line to take care of the high speeds. Each spindle is ⅜″ diameter and is provided with a chuck that will take in a 13/64″ drill. The centre distance between spindles is 7 inches. The distance from the centre of each spindle to the edge of its corresponding column is 5¼ inches. The machine occupies a floor space of 26¼ inches x 33 inches, and is 22¾ inches high. The weight is about 345 lbs.

VARIETY BELT SANDER

The Oliver Machinery Co., Grand Rapids, Mich. have placed on the market their No. 127 Variety Belt Sander. It is designed for rapid sanding and polishing of all kinds of irregular shapes, edge work, and flat surfaces. and also for polishing metal surfaces. A main driving pulley is mounted on a counter shaft, located on a substantial base, with a frame swinging about the center line of the countershaft and carrying a support arm. On this support arm are carried two clamp brackets, one of which supports the main idler pulley and the tension idler. The other supports the table and the backing plate or any forms of flexible pads desired. The machine will take belts up to 10 in. wide and 14 ft. long. The edging table is made of cast iron size 10 by 12 in. and tilts any degree up or down to 30 degrees. It can be adjusted in or out and has drilled holes for attaching wood tops or forms. The breaking plate is 10 in. wide, of cast iron, and can be adjusted in or out to suitable tension on the belt. It has drilled holes for attaching flexible pads.

The main idler runs in ball bearings and is adjustable up or down the whole length of the idler arm to accommodate various lengths of belts. This pulley is faced with leather. The tension idler, is of the ball bearing type and fulcrums in the centre line of the main idler, is leather faced and is balanced by weights to give the proper tension to the belt. The fork idler attachment is mounted on the machine in place of the regular table. It is used for doing oval sanding. The fork idler is rigid in construction and carries two aluminum idlers, which run on ball bearings and are adjustable to the work, the counter shaft is 1½ in. diameter, runs in roller bearings and the driving pulley is 14 in. diameter by 10 in. leather faced. Tight and loose pulleys 10 in. diameter by 5 in. face are supplied. The electric driven machine calls for a 2 h. p. motor running about 900 r. p. m. direct connected.

RING WHEEL GRINDER

The Graham Manufacturing Co., Province. R. I. have issued a circular describing their new Ring Wheel, Knee Type Grinder which has recently been placed on the market. The grinder is intended for wet grinding and can be arranged to drive by countershaft and belt, by belt from a motor mounted on a bracket attached to the column, or direct connected to a motor of from 1500 to 1800 r. p. m. No one motor is considered standard as the application of the machine is so wide that various powers may be required. The countershaft and regular spindle pulley are sufficiently rugged to take care of all requirements when the machine is being operated at full capacity. It is claimed by the manufacturers that the machine is easy of access to both cutting agent and work table; great rigidity exists between cutting agent and work table; that it will stand up under continuous work at full capacity; any available power can be applied; useful on production or tool room work; can be greatly modified in capacity, operation and scope; and is of simple design. In all cases the work is held directly on the table in special fixtures, vises, magnetic chucks, etc. Milling fixtures can be used on the machine although generally speaking grinding on this type of machine does not require work to be clamped as securely as when milling.

The design throughout is obtained from well tried and proven practices, such as the box shapes in the column and knee. The table is similar to that of a milling machine and is similarly controlled. The spindle is of low grade tool steel, hardened and ground, running in two Timken taper roller bearings. A collar is shrunk on for the abrasive ring holder. The dust collars are packed with felt and protected glass indicators show the height of the lubricant. To avoid end play a heavy adjustable coil spring presses the spindle back so that it is always in contact with the front end thrust races. The table slides are of liberal proportions with special lubricating facilities. A special Brown & Sharpe cutting lubricant pump is supplied. The travel is 16 in. longitudinally and 3 in. transversely. It lowers from about centre line of grinding arbor to 7 in. below it. The machine will grind 6 in. high, 12 in. along the table, and any length across the table. The power required to operate the machine varies from 5 h. p. to 15 h. p., according to the class of work being done. The height to the centre of the spindle is 42 inches. When belt driven a 6 inch belt is used. The floor space required is 6 ft. 0 in. x 6 ft. 0 in. The abrasive ring is 12 inches in diameter, with 8 in. hole, and the ring is 2 in. deep.

TURRET ROTARY SHEAR

Three news sizes of the "Gray" type of turret rotary shears have been developed and placed on the market by the Southwark-Gray Foundry and Machine Co., Philadelphia, Pa. These machines are adapted for cutting any shape of opening in sheet metal, without cutting in from the edge and without turning the sheet. This method of cutting sheets and plates is made possible by mounting the rotary cutter on a turret which can be moved to any angle through a full circle while the cutting action is in progress. The machine is now manufactured in four sizes the smallest being the No. O. on which only the lower cutter is driven. This machine is designed primarily as a hand-driven machine, but power can be applied. On all other sizes both cutters

are power driven. The special feature on the largest shear. No. 3., is the mounting of both the upper and lower cutters on adjustable turrets.

This machine has a capacity for cutting any thickness of plate up to ⅜ inch. Both the upper and lower cutters are set at an angle, and they keep the same relative positions at any degree of the circle to which they may be turned. Handwheels for revolving the turrets are provided on both sides of the machine. The cutting speed of this machine is 10 feet per minute and the throat depth is 36 inches. Three horse power is required for driving. The No. 2, machine has a capacity for cutting sheets up to No. 8 gage, a cutting speed of 10 feet per minute, and a throat depth of 30 inches. The No. 1. machine has a capacity for cutting sheets up to No. 14 gauge, with a throat depth of 3 inches. The No. O. machine will cut up to No. 16 gauge and has a throat depth of 18 inches. Special machines to cut plates up to 1 inch thickness can be made up to special order.

The smaller machines are used to produce various lines of products, including automobile aprons, pans, tanks, mud guards, flanges, fenders, radiators, etc. In general sheet metal work they are employed to cut elbows, tees, hoods. oil pans, ventilator spstem parts, etc. The heavier machines are employed to shear plates in building ships, locomotives and also to shear structural steel parts.

SPOTTING AND ROUTING ATTACHMENT

Frank N. Krag, Chicago, Ill. is manufacturing a spotting and routing attachment to be mounted on milling machines for use in the accurate lay-out and drilling of holes up to, and includ- 3/16 inch diameter, in dies, jigs, templates, and master plates, etc. The attachment is marketed under the trade name of "K-N" by E. L. Krag & Co., Chicago, Ill. The locating of holes by means of buttons is entirely unnecessary when the attachment is used. It is permanently placed in alignment by means of a locating screw in the base, which is locked in place after being adjusted. The driving arbor for the attachment is inserted in the spindle of the milling machine, and is provided with a spring dog that engages automatically when the machine is started.

The spindle of the attachment is driven by means of a round belt that is always kept at a uniform tension through the provision of a compensating spring idler, mounted in such a manner that the belt is always in alignment. The speeds of the attachment spindle and the machine spindle are in the ratio of 7 to 1. The spindle housing and the bracket which holds the guide bushings are cast in one piece to assure alignment at all times. The spindle sleeve can be locked firmly in any desired position, when using the attachment for routing, by means of a friction plug. Five guide bushings 1/16, 3/32, ⅛, 5/32, and 3/16 inch in diameter are supplied, and these are made of a high grade tool steel. The attachment is graduated to 360 degrees, and may be quickly adjusted to any desired angle. It is supplied for all standard makes of milling machines

PORTABLE ELECTRIC WELDING OUTFIT

The Bartman Machine Shop of Hanna, Alta.; has recently constructed a rather unusual electric welding outfit of the portable variety. In addition to being of the portable variety it is also independent of an outside source for its electricity. Therefore its field of usefulness will be limited only by conditions which will prohibit the transporting of the outfit.

An old Chevrolet 490 chassis was used as a foundation on which to place the equipment. A platform was built on the chassis. The engine was removed and placed transversely across the platform, at one end. Two Chevrolet fly wheels were bolted to the crank shaft flange, and were then machined so as to serve as a pulley from which power could be taken. In the other end of the platform a 200 ampere 4 k. w. belt driven welding generator was mounted. A 6 in. endless belt was used to transmit the power from the engine to the generator. The engine was operated at a speed of 950 r. p. m. Constant speed, under varying load conditions, was obtained in an ingenious manner. The cam shaft was extended in order to bring it through the timing gear cover, and a Pickering governor was geared to the shaft extension. This governor was connected to the butterfly valve in the intake of the carburetor. The principle is very similar to that of a throttle governing steam engine. A radiator is used to cool the water for the engine.

The welding panel is mounted near the generator, and the machine is not self propelled but is arranged with a self steering tow bar.

VERTICAL SPINDLE MILLING MACHINES

The Jackson Machine Tool Co., Jackson, Mich. have brought out an improved type of vertical milling machine for manufacturing and die sinking purposes. The machine, known as their No. 6A, has power feeds and their machine No. 5A has hand feeds. The hand feed machine is similar in most respects to the power feed machine except the table surface is smaller and some of the traverses are less. To facilitate operation the spindle has a vertical movement, manipulated by hand, through a mechanism permitting of both hand feed and rapid traverse. Near the lower end of the spindle is a vertical sliding housing, which carries both the lower main spindle bearing and the thrust bearing. The spindle and housing are counterbalanced by a weight inside the column, which is slightly greater than the weight of the spindle and attached parts, in order that all lost motion between the cutter and hand wheel may be taken up. A micrometer stop is provided for determining the depth of the cut and the vertical postion of the spindle. The spindle may be clamped in position when the proper depth is obtained. and then longitudinal or transverse cuts may be made.

In addition to these machines the firm has also brought out two other new vertical milling machines known as their No. 10-A and No. 10-B. The No. 10-A machine has a table and cross rail feed ranging from .001 inches to .015 inches per revolution of the spindle, and the No. 10-B machine has a range of feeds from 5/16 in. to 16 in. per minute regardless of the spindle speed. The machines are similar to the No. 10 die sinker put out by this firm except that they are fitted with a heavier vertical milling head and have no cherrying mechanism. Inside the milling machine head is a back gear arrangement whereby thirteen changes of spindle speeds are obtained. These speeds range from 8½ to 310 r. p. m. A simple pull pin lever throws the back gear in and out. All spindle speeds are obtained from quick-change-gear box. The spindle, on its lowered end, has an integral flange 6½ in. in diameter. Across the face of this flange is a ¾ in. keyway and into it two holes are drilled. which can be used for securing and driving large cutter heads. A 13/16 in. hole runs through the entire length of the spindle. This hole has a No. 13 B. & S. taper at the bottom.

This feature is useful for a draw-in bolt. All feed changes are made through the feed change box. A novel feature is a round table 36 in. in diameter which can be provided for circular and continuous milling. This table may be used as an attachment on the regular milling machine table. so that it may be removed when not in use, or it may have its bearing on a specially designed cross rail. Standard sizes of cutters are made for these machines, the cutters being 4, 6, 8. 10, 12 and 14 inches in diameter. All cutters are made from standard stock and may be used with any cutter head, the larger heads having backing rings for more securely holding the cutters

NEW CALCULATING MACHINE

The Monroe Calculating Machine Co., New York. have placed on the market a new line of calculating machines, built in 20-place, 16-place, and 12-place sizes. The outstanding feature of the machines is, the minimum of effort required to operate them, combined with great speed possibilities. Dial clearouts, and interlocking devices to prevent errors, all tend to make the machine of very practical usefulness in any place where numbers are added and calculations made.

The Business Paper Gets at the Facts

A STRIKING illustration of the service the technical or trade paper renders its readers and of the difference in the reliability of the information it supplies and that furnished by the average daily newspaper is afforded by an article in a recent issue of the "Railway Age Gazette" with reference to Henry Ford of automobile fame and railway management.

Mr. Ford as many of our readers will have learned from the newspapers, recently purchased the Detroit, Toledo and Ironton Railway, a small road which was practically in a state of bankruptcy. In the same papers they will also have read how Mr. Ford put in his management in March, and in April the net operating income had risen from $78,000 to $276,000. For several months past the various newspapers, magazines and labor publications of the States have been jumping at conclusions and drawing deductions from this one month's figures, enlarging upon the fact that, in spite of higher wages, Mr. Ford had succeeded in making his railway a paying proposition, and in many cases it was hinted that here was the man who could straighten out the railway systems of the country and place them upon a stable and profitable basis.

The "Railway Age Gazette," however, was not content to accept these hastily drawn conclusions as decisive and started an investigation on its own account, with the result that when the figures for several months of Mr. Ford's regime were examined a very different tale was unfolded. The income of $276,000 in April had dropped to $187,000 in July and in August to $70,000, lower than it was when Mr. Ford took the road over. Expenses, moreover had increased from 52.7 per cent. to 59.7 per cent. in July and 71.8 per cent. in August—this in spite of the fact that gross earnings which were $713,000 in June had increased to $744,000 in July and still further to $763,000 in August. Moreover, while the operating had thus increased 46 per cent., those of the ordinary railways of the country had increased only one per cent.

The point in this incident which immediately concerns our readers and ourselves is not so much the success or failure of a railroad as that to a business paper is due the fact of the truth being made known. During the last few years occurrences of this nature have been frequent in connection with the series of trade and technical publications of which this paper is one. Inaccurate and misleading information giving rise to serious complaints has been published on one subject or another by the daily papers. The public have been worked up to a pitch of indignation by some statement which upon investigation has been found to have no foundation, and it has been left to the business paper to show that the complaint was therefore groundless. It is the reliability and accuracy of all information published that differentiates the business paper from the ordinary newspaper and makes it of such high value to its readers.

Application of Ball Bearings

THE proper application of ball bearings is a specialized study. Unfortunately we have not arrived at the point where everyone is in complete accord. Each has his own viewpoint, and it is a difficult matter to move him from that position. This truth has been brought home to us very forcibly during the past few weeks. On November 10th we published the first part of ball bearing article appearing on another page of the present issue.

After publication, we received a criticism on the same, this matter also appearing in the current issue. We have taken up the matter with both authors, and each maintains his viewpoint is correct. The question is a debatable one, and those interested in ball bearings will no doubt bring their own knowledge and experience to bear on the points raised. As shop superintendents, designers and general managers will be the readers chiefly interested, we feel they are well able to judge for themselves the merits and demerits of the case.

MARKET DEVELOPMENTS

Business Is Very Quiet On All Markets

Production of Steel Ingots Has Decreased Somewhat—Prices on Various Lines Holding Up Fairly Well—Machine Tools Are Dull —Also Small Tools—Scrap Metal Market Stronger

THE past week has brought no important developments in the steel trade, conditions being much the same. Production has dropped a trifle, an average rate of 40 to 45 per cent. existing. This compares with a rate of 50 per cent. early in November, although the production in October was only 44 per cent. As things have been rather dull on the steel market since the middle of October, the present rate of production is none too bad. In fact it proves that a considerable volume of business must have been placed some time ago for execution during the remainder of the year, otherwise the rate could not have held up as it has done.

The regular prices on sheets remain steady. Tin plate prices are also holding their own, although a little amount of shading is being done. This however is not taken seriously by the larger mills. Tubular goods show no change, but in line pipe the cutting is quite deep, in some cases going below the cost of production.

The price on bars, shapes and plates remains about the same; although the tendency exists for lower prices. Should buyers reach the position where they could place large orders, a drop in price would be more than likely.

There is some talk of a consolidation of steel interests in this week's Pittsburgh letter. It should be read with interest, for if it goes through it may make quite a difference, for several economies could be effected in due course of time.

Outside of the work on the ice breaker at Vickers Yards, and the repair work on freight cars at the Canadian Car and Foundry Co., there is not much moving in the Montreal market. Machine tools are very weak, and while the small tool market is moving it is nothing near normal. The scrap metal market is also very poor.

In Toronto we have a very quiet market. Machine tools are barely moving, small tools have weakened somewhat, and the steel trade shows seasonal depression. The only branch showing signs of life is the scrap metal market, but even here the course is erratic. Although the various markets are rather dull, this was expected some time ago, so that one cannot truthfully say the market is in poor shape. A better way to describe it would be to say that everyone is walking carefully, buying only what they actually require. What the new year will issue in is another question.

PRODUCTION OF STEEL HAS DECREASED CONSOLIDATION PROPOSITION ON TAP

PITTSBURGH, December 8th. — The past week has brought no important developments in the steel trade, market conditions being much the same as for several weeks past. Production has receded a trifle. Prices on the whole show a less distinct sagging tendency.

Current estimates are that the rate of steel ingot production lies between 40 and 45 per cent. of capacity, this comparing with a rate of about 50 per cent. early in November, and an average of 44 per cent. in October, which had shown the highest rate since last February. As the steel market, taking it as a whole, has been relatively dull since the middle of October the rate of production is really very good under the circumstances, and points to a considerable volume of business having been placed some time ago, for execution during the remainder of the year. In a number of cases mills made drives for business, representing to their customers that they would cover them to the end of the year at close prices and that they intended to advance prices after they had made the rounds of customers. In most cases the predicted advances did not occur, and where they did occur prices are back to the old level. An instance of this is hoops, bands, and hot rolled strips, which were nominally advanced to $2.25 a few weeks ago after business had been booked at $2.00 and thereabouts, the open market price having lately gone back to $2.00.

While steel production is being supported in part by recent contracts, it is not to be supposed that there will be any decrease in production January 1 on account of contracts running out, for buyers are taking only such steel as they absolutely must have, desiring to keep inventory down, and there should be heavier production in January than in December, rather than lighter production.

The Question of Prices

The regular prices on sheets have been holding pretty well up to date. On November 25, as reported a week ago, the American Sheet and Tin Plate company opened its order books for the first quarter of the new year, at the prices it had previously been quoting for this year, $2.25 for blue annealed, $3.00 for black sheets and $4.00 for galvanized. Independents had previously withdrawn cut prices. Bookings are running rather light. The American Sheet and Tin Plate company still has an advantage over the independents by reason of its old contracts, many being more than a year old, but still not completely specified. While the independents have to make sales as they go along, the leading interest gets a considerable part of its business by entering specifications against the old contracts, simply adjusting the price as occasion requires. Contract prices themselves are not revised, merely prices to apply on shipments as specified.

The $4.75 tin plate price, announced November 3rd, by the leading interest to apply on prompt orders and contracts with jobbers for first quarter and manufactuing consumers for first half, is holding quite well. There is a little shading by one or two mills which do not have a reguar clientele, but this is not taken seriously by the larger mills.

Tubular goods show no particular change in the matter of prices. The National Tube Co., (Steel Corporation) is adhering to its regular prices while as

for many weeks past independents are shading slightly. In line pipe the cutting is quite deep, to levels which are said to be below the cost of production.

Bars, shapes and plates are quotable generally at $1.50 to $1.60, depending on size of order, specifications, etc. Prices are hardly any weaker on these lines than a fortnight ago, but they certainly are not stiffening, and the probability is that eventually buyers will be able to develop slightly lower prices when they are in position to offer larger orders and for more extended delivery. The mills would probably welcome an oppotunity to drop prices a trifle, to book a good volume of business and then make an advance.

Talk of Consolidation

At intervals for about ten years past, there has been talk of there being a consolidation among a number of the independent steel companies. None of these projects got very far along, but there is a project now that seems much more serious, there being perhaps a 50-50 chance of its going through. There is a project within a project, that is, four companies have gotten pretty close together, as one propositon, and then there is another that would take in three other companies plus these four. The seven are: Midvale Steel and Ordnance Co.; Lackawanna Steel Co.; Republic Iron and Steel Co.; Youngstown Sheet and Tube Co.; Brier Hill Steel Co.; Inland Steel Co. and Steel and Tube Co. of America. One important point about the consolidation, as a means of improving the condition of the producers, is that with the two Chicago district concerns included the practice of basing steel prices on Chicago could be eliminated, by a return to the Pittsburgh basing which obtained until competition became so keen this year. The seven concerns have a rated steel ingot capacity of 9,800,000 tons a year, or approximately one-third of the total independent capacity which is about 30,000,000 tons, while the Steel Corporation has a capacity of about 22,500,000 tons, making about 52,500,000 tons for the industry as a whole. In time the consolidation could effect some economies of importance by combining sales offices and in other ways, just as the Steel Corporation has done in its 20 years of development.

Pig Iron and Coke

The pig iron markets seem to grow weaker steadily, though prices do not decline to any extent, perhaps because there is so little inquiry and therefore real competition. The prolongation of the very light demand in the market is remarkable, and the conclusion can hardly be avoided that consumption by the foundries has been decreasing in the past few weeks. As the steel makers who buy their pig iron, are not running as well as the integrated companies, they thus are poor buyers of merchant iron. There is no prospect of any additional merchant furnaces getting into blast in the near future, but rather a possibility that some furnaces will go out, as not all the merchant iron being made at present is being shipped. The valley market remains quotable $20 for Bessemer, $19 for basic and $20.50 for foundary, f.o.b. valley furnaces, but it is recognized that on the appearance of any important inquiry these prices would probably be shaded.

Connellsville coke has weakened farther, and for spot furnace coke $3.00 is the top rather than the bottom. Spot foundry coke is still quotable at $4 for ordinary brands but the price is likely to be shaded. A few particularly favorite brands are held at $4.50, but meet with little sale.

POINTS IN WEEK'S MARKETING NOTES

Production in the steel trade has receded a trifle. Prices, however, show a less distinct sagging tendency. The production of steel ingots at present is approximately around 40 to 45 per cent.

This rate is not likely to drop further on January 1st, on account of contracts running out, for buyers are purchasing only what they actually require. Some think production will increase slightly in January, but of course not much.

The $4.75 price on tin plate issued on Nov. 3rd, is holding quite well. Tubular goods show no change, although a small amount of shading is being done. The prices on bars, shapes and plates have not weakened any during the last two weeks, but they are certainly not stiffening. When buyers are in a position to offer larger orders, lower prices may result, although the mills may in turn book a good volume of business, then make an advance in price.

A consolidation of interests is discussed in the Pittsburgh letter this week. Should this movement go through, it would mean combining sales offices, also effecting economies in other ways.

Outside of some activity in the Vicker Yards, and repair work to freight cars at the Canadian Car and Foundry Co., Montreal reports nothing of importance. The market is weak, and machine tools are merely moving. The small tool business is about the strongest member of the Montreal market, but even this statement does not infer the latter mentioned branch is anything near normal.

The only bright spot on the Toronto market is the scrap metal situation. Even at that it's not so very bright, but as this market is showing signs of life for the first time in many moons, there is reason to be thankful, even for small mercies. Machine tools are very quiet, and the small tool market has eased off considerably. The steel market is showing signs of depression, and little improvement is looked for this year.

LOCAL ACTIVITIES ARE VERY LIGHT

TORONTO, December 8th.—If there is any change on the local market this week, then it is a change for the worse. Every dealer you meet is carrying a grouch these days. There may be some exceptions, but they certainly are few and far between. At that you can't blame them very much for these have been very trying times. In many cases dealers have not paid expenses for some time back, and from the look of the market at present, they are not likely to do so for some time yet.

Take for example the steel market. They have now entered into what can be termed their slack season, although the business closed for some time back has been none of the best. From now on until the end of January they can only hope to pick up a few odds and ends, but their overhead goes on just the same. Usually they depend on their good season to carry them over the dull season, but as there has really been no good period they will have to be content to carry on as best they can. From the foregoing it is hardly necessary to state that the steel market is suffering from a state of seasonal depression. Dealers do not look for any improvement in the near future, in fact do not expect to land any business worth while for the balance of this year. As far as prices are concerned, there is no change, nor is there likely to be any this side of the New Year. To predict any further than this is rather risky, for no one knows very well what is going to happen at any time. One thing sure, dealers are not over optimistic as to the balance of this year. The only ray of sunshine, if one can call it so, is that the existing condition is only what they expected.

The Small Tool Market

Even the steady member of the local market, the small tool business has gone back on us. Up to a month ago this branch could always be depended upon for a favorable report, but now dealers tell us that they are disgusted at the amount of business closed. Manufacturers are buying only what they actually require, and cannot be convinced that they should stock up at present prices. The Christmas season is also blamed for the present lull, and some think that—the start of the New Year will see a change for the better. Prices remain the same, and it is unlikely that there will be any changes in the near future.

The Scrap Market

Luckily we have one bright spot on the local market this week, and that is from a very unexpected source, viz, the scrap metal market. Conditions have improved on this market, although the change has not been sensational by any

means. However, as the scrap metal market has been the black sheep of the family for some time it is pleasing to see it reforming. The present change for the better has been largely due to the improvement on the New York market. We are now getting the benefit of the move, and red metals and coppers are the active lines. White metals do not show much improvement, but the strength shown by the other metals make up for the whites. European countries have started buying again, and several orders have been closed for export. The only difficulty seems to be the price. This is rather unsteady. For example: up to Thursday of last week, prices remained fairly firm, but after that date they sagged somewhat. However it is expected that they will stiffen up again to their former level.

Machine Tool Market

This market remains very quiet. Enquiries come in all right but they seldom get beyond that stage. What business is being done is not for any large amounts. Interest continues in the new proposed Machinery Hall, although, as mentioned last week, some think the ten year guarantee is prohibitive, especially for dealers who are in Canada doing business for firms making machines outside of Canada. One dealer speaking on the subject says that if the directors of the Exhibition feel there is a demand for an Engineering Building, which point seems to be proven, would it not be better for them to erect the building and offer space on a yearly basis with an opportunity for securing long term leases?

This dealer goes on to say that he represents a recognized production line, various manufacturers being included. The total capital investment of this group would be exceedingly large, he continues, yet not one of them has failed to express an absolute unwillingness to enter into any contract binding them for a number of years. On the other hand they express an appreciation of the opportunities afforded by this annual exhibition and would be very willing to exhibit their tools.

We would plan to use a large space with a collective exhibit of our various lines, concludes this dealer, but we can only interest our principal on the basis of a one year lease. This brings up an interesting point, and one which the exhibition authorities should think over carefully.

Taking the local market collectively this week, we should say that although very little business is moving, the market is in a quiet, but healthy condition.

MILLS ARE ANXIOUS FOR BUSINESS; MACHINE TOOLS MOVING VERY SLOWLY

MONTREAL, December 8th: — The past week has not developed any large business deals but the volume of trade closed has been about the same as the past few weeks. The heat of the election contest, which is now on the home stretch, has had a great deal to do with the tendency to let business become of secondary importance. The larger firms view, with no little anxiety, the possibilities which could result from the polling. Around the Vickers Yard more or less activity is present owing to the fact that work on the new ice-breaker is under way. The Canadian Car and Foundry Co., are making good progress on the repairing of the freight cars for the Canadian National Railways. Owing to the warmer weather that followed the cold snap of a week ago building operations are being rushed on all the larger structures also on many smaller buildings.

The steel situation has not changed a great deal. About the same tonnage seems to be required from week to week. Quotations are the same as have been used for the last two weeks. Other lines of the iron and steel business are moving in the same nominal way as has been reported for several weeks past.

Mills Are After Business

There is every evidence that the mills are very anxious to secure a greater volume of business. The present prices are as low as can be expected, and really leave little or no margin for producer or jobber. In fact many of the latter, who have carried a small or fair sized stock for some time, are complaining they are losing money at prevailing prices. In fact the margin is so small that every small saving counts. Those who have modern warehouses and can handle material in an efficient manner are able to make the little savings that go to total up a profit. Many firms, other than jobbers, are actively hunting up business in small lots. Thus the country is being scoured for all possible business. Conditions are very much the same across the border where there is little business offering and prices are cut to the minimum. The demand for structural steel has fallen to a low point as was expected. Merchant bars are still very sluggish. Sheets and thin plates are in fair demand.

Pig Iron Market

No changes in the price of pig iron have been announced during the last week, and there is every reason to believe that the present price will hold till the first of the year. The volume of business passing during the last few weeks has not altered greatly and it is not expected that the reduction in freight rates will have any effect on the quotations. There is a great deal of confusion existing about the amount of the reduction, for many understood it was a straight ten per cent. reduction.

As it is, the change will not enter into the price asked for pig iron. Some claim that the present quotations barely cover production expenses.

The volume of sales in machine tools during the past week has not been any more encouraging than the reports we have been able to make for some time past. In reviewing the situation however, the future does not look too dark. We have been, as a country, supporting a large number of contract and jobbing shops, where manufacturing in a small way was carried on. Gradually, as our markets became greater, we adopted modern manufacturing methods and have come into the market for special and automatic machinery as well as many labor saving devices, tools and fixtures. Our modern manufacturing establishments are meeting competition, and the smaller shops realize that the very latest in machine tools and equipment must be made use of to successfully meet the competition of the coming war for commercial supremacy.

Perhaps our experience in manufacturing war material has served to educate us, for many of our shops at present have their purchasing agents and superintendents closely studying the developments in the machine tool field. We must admit there is a big surplus of engine lathes, planers, drill presses, and the commoner types of general purpose machines. These will rapidly disappear as soon as business improves, as in many cases they have seen heavy service or are not suited to production work. One need only glance at a machine tool catalogue, or read circulars describing modern tools and it is realized that the type of machines now being manufactured are improvements over those offered for sale two or three years ago.

This is the factor that will swing machine tool sales into the limelight, and will make big business as soon as conditions improve. In fact this business will begin to move many new lines as soon as machine shop men are educated to the value of the modern lines now being placed on the market. Price reduction will not build up any permanent business, because if a need for a machine does not exist, a manufacturer will not buy. When he requires a machine he desires a machine from a reputable manufacturer and price is seldom the first consideration.

Small Tools and Supplies

Continued good business is the report from this section of the trade. Prices in the various lines are maintaining about the same level, with a slight tendency to become lower as production increases and the cost of labor and material comes down. In this field also there have been many new and labor saving devices that have been offered for sale, these having been met with fair reception. The number of portable tools that are being placed on the market is of interest. The various uses of such tools interest a new line of customers, namely automobile garages. This new field has stimulated the amount of business done in these lines. Prospects are that the regular channels will produce more business in the

INDUSTRIAL NEWS

NEW SHOPS, TENDERS AND CONTRACTS
PERSONAL AND TRADE NOTES

INDUSTRIAL NEWS

Alexander Gibb, manufacturing agent of Montreal, has secured the agency for Eastern Canada, for the Canadian Tools Ltd., of Bridgeburg, Ont.

Three new buildings have been authorized in connection with the new Albert College, Belleville, Ontario. The total cost will be about $500,000.

The Malleable Castings Co., Smiths Falls, Ontario, reopened a part of their plant on November 30th. Fifty men were taken on as a start.

Georgetown, Ontario, has awarded the contract for the instalation of a waterworks pumping plant to Goldie and McCulloch, Galt, the cost to be $9,383.

The Strathroy Furniture Co. and the Middlesex Furniture Co., both of Strathroy, Ontario, report that business is taking on a brighter outlook. Both factories are running full time and recently have made additions to their staff.

The Canadian Vatu and Air Drying Manufacturing Co., with plant at Island Lake, near Sault Ste. Marie, has received an order for 25,000 dozen baseball bats from the Bregent Sports and Cycle Co., Montreal, and new machinery is being installed to handle the increased business.

We are in receipt of an inquiry as to who manufactures "Killametal." This is evidently a compound for the purpose of nullifying the chemical reaction of metals. Any information as regards the name of the manufacturer, or where this product can be secured, will be welcomed by the Editor.

The Colonial Motors Ltd., have now purchased the Canadian plant of the Detroit Lubricator Co. on Walker road, Walkerville. The transfer includes land, buildings and machinery.

Official announcement is made that work on the new hotel at the corner of Richmond and Fullerton streets, London, Ontario, is to begin at once. The hotel will have three hundred rooms and is to cost about $1,500,000.

Plants in the shoe-working industry have been running practically at capacity during the month of October, 1921. The Province of Nova Scotia reports that there production was 100 per cent. London, Ontario, also reports 100 per cent. Kitchener, Ontario, 90 per cent; Quebec reports 75 per cent, and Montreal 95 per cent.

Operations recommenced at the Brantford plant of the Massey-Harris on Monday of last week, about one-third of the normal working force going on a three day a week shift. The plant employs about 1,000 men normally. Binders will be produced at the Brantford branch for both home and export trade.

The plant of Scottish Fertilizers Ltd., one of Welland's new industries, is rapidly nearing completion, and will probably be ready to commence production early in the new year. The plant was designed by British Chemical Engineers and embodies some of the best ideas of British and American practice.

Cameron and Ralston, Windsor, have been appointed architects for the proposed Essex County Sanitarium, by the advisory committee of the Essex Health Association. Gordon M. McGregor, vice-president of the Ford Motor Company of Canada, is chairman of the committee. The building will be erected in Sandwich at an approximate cost of $150,000.

We learn that the Rand Water Board, Johannesburg, South Africa, has awarded the contract for about 8,500 tons of lapwelded steel water pipes of 18 to 24 inches diameter, to the Mannesmannroehren-Werke of Dusseldorf, Germany. The Rand Water Board has used Mannesmann tubes before to a very great extent, and we understand that the contract was secured against keen competition.

The Weeks Engineering Corporation, an American organization, has decided to establish a plant at Welland, Ontario. The principal product of the new works will be boiler plates. The company is taking over the Welland Machine and Foundry Company and will install machinery almost immediately. Additional buildings will be erected next spring and the entire site consisting of four acres, provides room for expansion. It is estimated that between seventy-five and one hundred men will be employed in the boiler tube plant.

A fair amount of business is on hand at the Port Arthur Shipbuilding Company Yards, that ensures active operation during the winter months. Extensive repairs will be made to the steamer Huronic, an American vessel that was bought by the Matthews Steamship Co., of Toronto, and which is to be converted into a Canadian vessel. Two large boilers are to be built for the western market. The company plans to construct twenty low-pressure heater boilers of various sizes during the winter. Hopes are entertained that a contract for the construction of a large bulk freighter for lake service will be placed in the near future.

The City of Guelph are preparing to purchase some equipment for the Civic Water Works plant in connection with the decision to supplement the present steam equipment with that of electrically driven centrifugal pumps. It has been definitely decided to purchase one three million gallon electrically driven centrifugal pump, and one three million gallon electrically driven booster pump, as an auxiliary, two three million gallon gasoline or Diesel driven units will be purchased. It has not yet been decided whether these will be served by gasoline or Diesel engines but it is expected that a decision will be reached shortly.

The King Suspender Co., Toronto, sold out their stock at sharply reduced prices last May. They then manufactured quickly, and well with low-cost material. A strong advertising campaign was cast and nearly the whole staff were sent on the road. The sales-staff was increased as it was realized that, with dealers buying from hand to mouth, more calls were necessary. The plant is working full time, and two auxiliary plants in Toronto, and two in Montreal, are adding to the output. The company is two months oversold in neckwear and have not taken orders for three weeks. Business in dollars and cents during the past three months has been more than last year; while, owing to lower prices, the quantity of goods sold is twice as great.

P. W. Cook, junior commissioner of the Department of Trade and Labor, was in Windsor lately with the page proofs of a bulletin entitled "Canada as a Field for British Branch Factories." The Border Chamber of Commerce, particularly the Manufacturers' section, has been assisting with material for the bulletin. In an interview, Mr. Cook, explaining the object of the publication, said: "What we are trying to do is to cut down the importation of manufactured articles. Last year we spent $100 in the United States for every man, woman and child of our population. Fifty-five of these $100 went for coal and iron and steel, but forty-five of each $100 was for manufactured goods, which might

just as well have been made in Canada. We have an abundance of man-power, water-power and natural resources that England has no idea of. Less than 90 per cent. of our factories use coal to generate power. The American firms have been quick to appreciate the industrial opportunities in Canada and at present there are ten American plants to each one established by British interests. The British manufacturers need educating and that is the object of the builetin.

The Vulcan Co., London. Ont., has been incorporated to manufacture iron, steel, brass, copper, metal products, etc., with $250,000 capital stock.

It is believed that the Forbes Vibration Co., St. Louis, Mo., intend establishing a plant in Canada for the manufacture of toys, etc. The location has not yet been decided.

If Guelph can raise $320,000 they will erect a new high and technical school. Day and evening classes will be held in such a school, but so far the matter is only in a proposed state.

The William Hamilton Co., Peterboro, Ont., are building certain machines for the Canadian Electric Co., which is establishing a plant in St. Catharines.

A fire amounting to a total loss of $200,000 occurred at the Woolworth store and Royal Bank Building at Calgary, Alberta recently. Both buildings are absolutely destroyed and it is expected they will be built up again in the near future.

Denmark has established a Consul General as a result of increased commerce between Denmark and the Dominion. Canada recently sent a trade commission to Denmark. Both moves are efforts to mutually increase the volume of trade and exchange products.

The production of steel ingots in October was at the rate of 23,000,000 gross tons a year or about 44% of production capacity. This rate is about 1-3 greater than the rate in September, or more than double the rate in July.

Figures secured from the report of the report of the Provincial Minister of Lands in the Province of British Columbia show that exports for the eight months ending August 31st, 1921, of lumber were 101,604,256 feet.

The Bell Piano and Organ Co., of Guelph, Ont., have been considering the installation of two new boilers to replace the three at present in use. According to the engineer in charge an order for these should be forthcoming in the course of a few months.

The Rae Machine Tools Company, plant, Hamilton, Ont., has been reopened for the manufacture of vises and other metal working tools. The plant was closed down two months ago; at that time a general line of machine tool was manufactured.

The Canadian Carbide Co., Montreal, have joined with the British Cellulose Corporation and others in an application to have carbide declared a key industry under the new Protection for Industries Act. If the application succeeds, Canadian Carbide will have the advantage of preferential entry of the 33 1-3 per cent. duty which will be imposed on the foreign products.

Mr. Hyndman, general manager of the Canadian Metal Products, Ltd., Guelph, says he is satisfied with the amount of business closed so far this year. He claims it is about 70 per cent normal. He is very optimistic about the future and feels the coming year will see things moving in a big way.

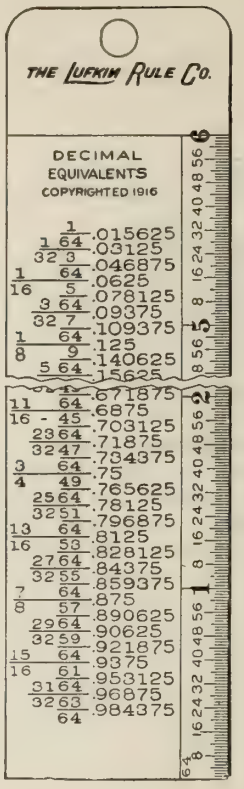
The erection of a central heating plant for the general hospital is being considered by the city of Guelph. Work will be proceeded with as soon as they can raise the sum of $30,000, this being the cost of the equipment they have in mind. Some action will have to be adopted shortly for the present equipment is said to be both insufficient and inefficient.

The Lloyd factory, a branch of a large United States concern, which was opened at Orillia, Ontario, last year, is adding new machinery and getting ready for a general advance of business. They are manufacturers of baby carriages, and furniture, and are not only buying new machinery, but are also occupying greater floor space and expect further additions will soon be necessary in order to supply the Canadian demand.

The Gibson Mfg. Co., report another successful year. Although last year's business was exceptionally good for them, this year is only 15 per cent lower, even in spite of the present depression. Mr. Cooke, the purchasing agent stated to Canadian Machinery, that his firm took an early lead in reducing costs. This in turn made better sales. This firm have decided to purchase two new boilers, also some sheet metal machinery.

The Ontario Agricultural College, Guelph, Ont., is to have two new buildings erected to be ready for occupancy in a year and a half. Building operations have already commenced. They will consist of a Dairy and a Veterinary Building together with a power plant, the whole to cost in the neighborhood of $150,000. Up to date, motor driven machinery will be installed in the dairy building which will, when competed be one of the finest equipped institutions of its kind in the country. The power plant will consist in the main of two 75 h.p., h.r.t. boilers.

Bowmanville is coming back to its own as an industrial centre and influential men have obtained a charter under the heading of Bowmanville Securities, to promote industrial conditions for the town generally. They are underwriting the Thomason Knitting Co., who have now established their factory in the premises formerly occupied by Messrs. Rhieder & Son. A short time ago the shareholders and friends, including the mayor and other prominent men, gathered together to inspect the plant, and in the near future we intend to give a descriptive review of these works, which are using machinery or representing improvements of a special character likely to be of interest to the trade.



According to reports Krupps of Germany have asked for details regarding the Delaware bridge, which is soon to be building in the United States. The belief has been expressed that Krupps intend bidding for the contract. Letters of inquiry have also been received from English, Belgian and other foreign firms, one inquiry coming from China.

Some figures obtained from the November bulletin of the department of development in connection with the Canadian Pacific Railway show that Canada has risen to second place among the wheat growing countries of the world. The expected yield of wheat for the year 1921 from the Dominion is $288,493,000. Reverting back to the year 1870 we find that the total value of all field crops was $111,116,606 and that of the wheat $16,993,265. In 1920 these values were respectively $1,455,244,050, and $427,-357,300. In 1920 the Dominion obtained for the first time in her history a billion dollar crop, more than trebling the value of the crop grown a decade previously.

J. R. Baxter & Co., 102 St. Antoine street, Montreal, will in the very near future let the contract for the construction of a 200-foot by 60-foot factory in Brockville, Ontario, for the manufacture of abrasive wheels. The foundations will be laid before Christmas and the plant in operation by the spring. Two kilns will be used to begin with and a third and a fourth added as conditions justify. A new company will be formed for which incorporation papers will be taken out later and which will be operated as a separate concern from the J. R. Baxter & Co. Mr. J. R. Baxter, who will be the president of this company, formerly occupied the same position in the Dominion Abrasive Co. of Mimico, Ontario, and as such has had considerable experience in the field. The idea behind the new organization is to go out for British Empire trade. With this object in view Mr. Baxter recently spent some months in England studying conditions with a view to building the plant there, but it was found that costs, particularly in connection with taxes and labor, were so high that production would be cheaper in Canada so that it was decided to retain the organization in this country although an English branch has been organized for the export trade which it is hoped to develop. The organization of the company has been held back for eighteen months until a competent expert for the manufacture of abrasive wheels has been secured. This has been accomplished in the engagement of Mr. Edric Sawyer, formerly with the Dominion Abrasive Co., and also with the Safety Emery Wheel of Springfield, Ohio. Mr. Sawyer will be the manager of the factory.

A New Contest—Open To All Readers

The editors want to make Canadian Machinery as newsy as possible. Every week three or four pages of interesting and valuable news appear in our Industrial News Section, but we know there is a great deal more information to be obtained, the difficulty being to bring it to light. This is where we feel our readers can help us. Read the conditions stated below, then decide to help us **NOW.**

A word about the prizes. These scales are 6 in. long. They are made from finest quality steel. One side is marked in 32nds, the other side in 64ths. A table of decimal equivalents is stamped on the one side, while a table of tap drill sizes is placed on the reverse side. Each scale is enclosed in a suitable case and every reader should strive to obtain one. Send in your item **NOW.**

What You Have To Do

As stated above, we are anxious to make our Industrial News Section still more valuable. Our readers can help us wonderfully in this respect, sending in each week, short items relating to industrial activities in Canada. These items **must** be real news and **must** not be clipped from other papers. A study of our present Industrial News Section will help readers to distinguish what constitutes a real news item and for their guidance we offer the following suggestions:

Let us have items dealing with the formation of new companies; reorganization of old companies; new factories to be erected; plant or factory extensions; changes in personnel of firms; appointments or promotions; contracts about to be placed; equipment or machinery required, or new equipment or machinery about to be marketed.

In every case the editor is to be the judge as to the value of any item received and he is at liberty to use or reject any material. A prize will be given to the readers sending in the best item, or items, each week and to make it interesting we will give two scales as prizes every issue. Make up your mind to secure one of these scales. They are well worth having. Obey the impulse, send in your item **NOW.**

— Important Note —

Readers should arrange to send their items so that they will reach the Toronto office early Monday morning of each week at the very latest. Of course, they should be forwarded before this if possible, but our forms close early Tuesday morning each week, and no matter can be used after that time. Should an item arrive too late for publication in one issue, if considered worth while it will be held over for another week, still being eligible for a prize.

INDUSTRIAL NEWS

The Brantford branch of the Massey-Harris Co., have taken on 200 of their old employees owing to the re-opening of the plant. The Cockshutt Plow Co., of the same city have also started 150 men. Both firms expect to increase the stock as soon as the various departments can be opened up.

In all probability the sum of $100,000 voted by the legislature at the last session for providing additional parliament building office accommodation will be utilized in the construction of the new building on the site of 17 Queens Park, Toronto. Honorable F. C. Biggs, Minister of Public Works, is having tentative plans drawn up for a new departmental block on the east side of the crescent.

The report of the Toronto City Architects Department for the past month shows an aggregate of building, for which permits were issued, mainly stores and dwellings, exceeding a sum of $2,000,000. November permits for 1920 totalled only $1,800,000. The Board of Education has been given a permit for the new Rose Avenue school, the construction of which will cost $175,000.

The Lang Manufacturing Co., of Guelph, Ont., report a successful year to date. Sales sheets already show double the volume of business transacted last year, and Mr. Skidmore, the general manager says that he has every confidence in redoubling his business during the coming year. Ornamental and architectural iron work is the main line of manufacture and Mr. Skidmore attributes the rapid growth of business in this line to increased building activities. A new building will be erected next spring by this company which will be used as an automobile repair department.

Another Monthly Statement has been issued by the Canadian National Railways. The President, Mr. D. B. Hanna, has stated that the net earniings for the month of October, 1921, are $1,036,130. Comparing these figures with the September net earnings, which were $500,000, it shows an increase of 105 per cent over last month's total. Figures supplied by the Dominion Bureau of Statistics, at Ottawa, show that the operating ratio published by the Canadian Railways for August was 86.41 per cent., which was a decided improvement over August last year. In August, 1920, the ratio was 98.82 per cent. The improvement was effected by reduction in operating expenses, the greater portion of which was brought about by a $5,118,010 reduction in pay rolls.

The Algoma Steel Co. has just given a two months' trial in ore unloading to a new bucket designed by one of its own engineers, Mr. Carl Stenbol. It is said that this bucket has been responsible for an increased capacity of 50 per cent. on the bridge, on which it was installed. It is of the grab type, with a large spread, although comparatively lighter than the older style in general use. It is planned to use it for unloading boats as well as for handling ore from the pile. Mr. Stenbol is mechanical superintendent of the Algoma Steel, and the manufacture of his design was made by the Blaw Knox Co., of Pittsburgh. One feature claimed and for which orders have been received from England, is its comparatively small cost of upkeep.

According to a report issued by the Bureau of Mines, Southern Illinois and Kentucky are credited with approximately 90 per cent of the fluorspar production of the United States. A small amount of high-grade acid spar is obtained from the ore by hand sorting; the greater part, however, is recovered by jigs and tables as gravel spar containing approximately 85 per cent. calcium fluoride. In the jigging and tabling operations, galena is recovered, and enough silica and calcite are removed to raise the calcium fluoride content of the gravel spar to 85 per cent. However, the removal of silica and calcite results in a large loss of spar. With increasing depth in the mines, zinc sulphide, sphalerite, is encountered in increasing quantity and the removal of this is said to have become a serious problem.

A cable from London, England, states that in some things Canada can beat Germany at her own game of cheap production. According to the Mercantile Guardian, after going the rounds of the world's markets, buyers for the first time in many months find Canadian Aluminum the cheapest, selling at 14½ pence per pound, while the German product, despite the deprecation of the mark, is 2 pence dearer. The Canadian product, which is often called American, because it is shipped from New York, is said to be of exceptional quality.

In last week's issue mention was made regarding the mayor of Sydney, Nova Scotia Mr. Fitzgerald, who visited the minister of railways together with presidents of railroad companies at Ottawa with the object of securing steel rail orders so as to help the unemployed problem. This has resulted in an order for 21,000 tons of steel rail, which has been given to the British Empire Steel Corporation by the Dominion Government. It is believed that an additional order will be coming along for a somewhat similar total in a very short time.

OBITUARY

The death of Lord Mount Stephen occurred at his residence in Hertfordshire, Brockett Hall, Hatfield, England, on November 30th. Lord Mount Stephen was in his 93rd. year. He was born in Scotland in the rural community of Aberdeenshire, June 5th, 1829. He spent his early days there and in Banffshire. He never forgot his school days in Dufftown. He was born a commoner and was known as plain George Stephen. He started life as a shepherd boy, later going into a draper's establishment in Aberdeen. He soon entered the services of a shipping office in London. An opportunity of coming to Canada presented itself shortly after, and he came to Montreal in 1850. He entered business as a woollen merchant, in 1862 was in control of the business. He also achieved great success and amassed a great fortune in the textile manufacturing business. He became a director of the Bank of Montreal and in 1876 became president of that institution. Through his connection with the bank he became interested in railways. With his Scottish cousin, Sir Donald A. Smith, (later Lord Strathcona) he accepted the responsibility of building the Canadian Pacific Railway across the continent. The Canadian Government had only built 700 miles of the road and the enterprise was apparently doomed to failure. This railway syndicate, as it was then known, received $25,000,000,00 in cash and 25,000,000 acres of land as a subsidy. Difficulties of all kinds, some almost insurmountable, confronted the railway builders time and time again. Lord Mount Stephen's brilliant personality, his faith in the future of Canada, and his courage, were outstanding in the days of political and financial difficulties. In order to complete the road, the personal fortunes of both Lord Mount Stephen and Lord Strathcona were pedged. Many of his securities had to be sacrificed to raise funds. Lord Mount Stephen became the firt President of the Canadian Pacific Railway. He was plain Mr. Stephen when he was elected to this office in 1881. He held office until 1888 when he resigned.

His gifts to hospitals and other worthy objects were princely, and he distributed his vast fortune in a lavish style. For the past twenty-five years he has lived quietly in retirement in England but always took a keen interest in Canadian affairs.

A MUTABLE ELECTRIC SIGN

Dwellers in cities have become quite accustomed to the large electric signs which flash out a variety of messages. They have little idea of the complicated mechanism which is required to provide a series of messages, or the ingenuity involved in their design. The latest type which has been evolved by a British inventor after more than ten years experiment constitutes a remarkable advance on existing types. Letters, words, sentences, and designs are produced by pneumatic power from movable spheres, each six inches in diameter. By day the spheres twinkle white or in contrasting colors as fancy may dictate, and at night they are automatically illuminated electrically. A sign may be withdrawn and another inserted in its place wthout stopping the machinery; in fact a whole speech could be expressed line by line, and thus delivered more effectively than by megaphone. There is no end to the variety of letters and words which may be made to appear on this sign. The mechanism depends on a simple arrangement of perforated sheets.

LONDON AND BIRMINGHAM WILL HOUSE ANNUAL BRITISH INDUSTRIES FAIR

THE EIGHTH Annual British Industries Fair will be held in London and Birmingham from Feb. 27th to March 10th, 1922. A large number of important lines of British trade will be shown, although the fair cannot be termed merely an exhibition, because it is purely a trade fair where buyer and seller meet. A considerable number of Canadian buyers are making arrangements to attend, and admittance is restricted to trade buyers on invitation of the British Government, thus business is not impeded by crowds of sightseers.

In organizing the fair, the British Government Department of Overseas Trade pays particular attention to the comfort and convenience of buyers from the various Dominions and other parts of the world. Special reading and writing rooms are available where buyers may consult qualified officers of the Department who will be able to indicate sources of supply of any goods required and to give information regarding tariffs, shipping and transport, trade conditions, etc., throughout the world.

The British Industries Fair covers the following industries at London: Cutlery; silver and electro-plate; jewellery, watches and clocks; hard haberdashery; glassware of all descriptions, china, earthenware and stoneware; paper; stationery and stationers' sundries and office appliances; printing; books; fancy goods, including traveling requisites and tobacconists' sundries; boots and shoes and shoe mercery; leather for the boot and shoe, fancy goods, bookbinding and upholstery trades; brushes and brooms; toys and games; sports goods (including sports clothing); scientific and optical instruments; medical and surgical instruments and appliances; spectacle ware and opticians' supplies; photographic and cinematographic apparatus and requisites; musical instruments; furniture of wood, cane, wicker; bedsteads and bedding; carpets, linoleum, etc.; basketware, chemicals, light and heavy; domestic chemical products; drugs and druggists' sundries; perfumery; dyes; foodstuffs (prepared and preserved) and beverages; confectionery (sugar and chocolate); tobacco, cigarettes and cigars.

At Birmingham

Lighting plant for electricity, gas, oil, etc.; cooking stoves and utensils, including aluminum, enamelware, etc.; foundry appliances; general hardware, including builders', marine and household ironmongery of all descriptions; general machinery of all descriptions and small tools; mill furnishings; india rubber goods for industrial and household purposes; motor cycles and cycles; accessories for motor cars, cycles and aeroplanes; weighing and measuring appliances and instruments; sanitary appliances; paints, colors and varnishes and painters' requisites; railway equipment; metals of all descriptions (excluding precious metals); agricultural and horticultural machinery and implements; mining, colliery and quarrying plant; brewing and distillery plant; metal furniture for house, shop, office, garden and camp use, including bedsteads; building construction; perambulators, mailcarts and push-chairs; saddlery and harness; firearms; fishing tackle and rods; tubes in copper, lead, brass and steel and steam and pipe fittings; architectural and ornamental metal work, including gates and fencing; ropes of steel and hemp, cordage and string.

The London section of the fair will, as in 1921, be housed in the White City, a large group of exhibition buildings within a few minutes of the centre of London, and connected with every part of the London area by trains, omnibuses and street cars, while the Birmingham section will again be in the buildings of the Castle Bromwich Aerodrome, which may now be regarded as permanent exhibition buildings, within easy reach of the centre of the city. There is a floor area of more than 1,130,000 square feet which is well suited for the purpose, and it is interesting to note that the gangways between the stalls total no less than 3 1-2 miles in length.

The British Trade Commissioners in Canada will be pleased to give full particulars and to issue invitation cards to Canadian buyers who propose to visit the fair at their following addresses: 248 St. James Street, Montreal; 260 Confederation Life Bldg., Toronto, and 610 Electric Railway Chambers, Winnipeg.

PROMPT SERVICE IN PIPE SHIPMENT

What may be considered as a record in the fabrication and shipment of riveted steel pipe was made in the extension of the Keele Street sewer at Sunnyside, Toronto, by the Dominion Bridge Company recently. The extension consisted of three pipes, each 560 feet long, two of these 90" in diameter and the third one 60" in diameter. The total weight of the contract was 612,000 lbs. The inland ends of three pipes are in the form of thimbles built into a concrete wall. The outer ends pass through the crib work which has been put in place as a retainer for the new "Marginal Way." The pipes are not quite straight throughout their length, they have each two elbows, but the angle of deflection at each of these elbows is less than 3 degrees.

The three thimbles were required in advance so that they could be set in the concrete, but the shipment of the balance—practically the whole of all three pipes—was called for to be made at one time and not later than November 1st, under penalty. The erection to be performed by the Toronto Harbour Commissioners who contemplated the laying of the whole pipe on trestles and sinking it altogether.

The contract was awarded to the first mentioned company, on September 30th. On account of the character of the work, they decided to fabricate the pipes at their Lachine plant, where their boiler department is equipped for this work. The specification called for boiler quality material. The orders for the material were mailed on October 1st, the day after the awarding of the contract. Prints of the shop drawings were mailed for approval on October 4th, four days after the date of the contract. The material was rolled promptly and was received at the Lachine plant between the 17th and 20th of October. The thimbles were shipped within the stipulated time. The final shipment of pipe was made from Lachine on October 29th and consisted of 29 carloads, each car containing one or two lengths of pipe about 40 feet long. The ends of each section were fitted with flange angles bent to a circle and welded, their outstanding legs being drilled for connecting bolts. This final shipment actually arrived in Toronto at twenty minutes past three on the afternoon of October 30th, two days ealier than the date on which the pipe was called for to be shipped from Lachine.

F. R. WHITTALL

F. H. Whittall, managing director of Whittall Can. Company, who was elected president of the Export Club of Montreal and district, which was recently organized under the direction of the Canadian Manufacturers Association and endorsed by the Department of Trade and Commerce. The Montreal Export Club is a branch of the National Export Clubs and is affiliated with the C.M.A.

T. P. Howard was elected honorary president by acclamation; Kenneth Laws of the National Breweries, 1st vice-president, and J. A. Lapres, of Canada Cement Company, 2nd vice-president.

What Will Steam Locomotive of Future Be?

THE GREATEST single item of a railway company's costs are those connected with the running of its locomotives. In the past, railway travel has developed along the lines of higher speeds and more luxurious accommodation, both of which have necessitated the building of more powerful locomotives, meaning in turn a greater fuel consumption and increased running expenses. There is no indication that the future holds anything different in store; in fact, with growing competition from other methods of travel, railways may have to offer still greater facilities than they have in the past. Mr. H. A. Ivatt once remarked that when an engine was built big enough to pull a street of houses—or words to that effect—the traffic department always wanted to couple up the schools as well. Perhaps a hotel will be now required in addition. Who knows?

Compounds And Simples

Speaking generally, continues "The Engineer," who thus speaks on the steam locomotive of the future, the locomotive, unlike other steam engines, has resisted all the efforts of those who have sought to change it from simple to compound expansion. In making this statement we do not overlook the various compounds working on the continent of Europe and in the United States, but compared with all the locomotives in the world, they form but a very small part.

The efforts of such eminent engineers as Webb and Worsdell in this country, Vauclain and Cole in America, and De Glehn and others in Europe, are still fresh in our memory, and it almost seemed at one time that through their ingenuity the compound system was in a fair way to be practically established as a real means of reducing locomotive operating costs through economies in the use of fuel and water. Indeed, there is little doubt that under certain conditions compound engines did effect some economy in fuel consumption; but certain inherent characteristics mitigated against their general adoption, the chief of which was the falling off in economy as the working speeds became higher. Under the same condition the economy of the simple engine improved, and against that fact the compound was unable to contend.

At St. Louis several different locomotives were tried on the testing plant. Amongst them were four different compounds, each having four cylinders variously arranged. Throughout the range of the tests these engines showed an economy in steam consumption per unit of power developed when compared with simple engines. The performance of the De Glehn compound, as against that of a simple Pennsylvania "Atlantic," tested at Altoona, may be particularly noted. The compound consumed at a piston speed of about 500 ft. per minute 20 lb. of steam, against 28 lb. used by the simple; but at 1100 ft. the consumption of the compound had risen to 23 lb., as against somewhat less than 24 lb., used by the simple. The Vauclain and Cole compounds, whilst they both seem to have given generally better results than the De Glehn engine, showed by their curves of water consumption the same characteristics as the De Glehn engine, a point of more than usual interest, for the French engine had four sets of valve gear enabling independent adjustment of cut-off, and the American engines were not so fitted. Of the Vauclain and Cole compounds, the former gave the best results at the higher speeds, its water rate varying from 20 lb. to 21.5 lb. at piston speeds of 650 ft. to 1250 ft. per minute, the latter figure showing an economy of 10 per cent. over the results given by the simple "Atlantic" at the same speed, while at 650 ft. per minute the simple engine required 24 per cent. more water than the compound.

The "Hanover" engine tried had, in addition to compound cylinders the important advantage of a superheater furnishing "low degree" superheated steam. The curve of steam consumption for this engine was, in character, almost exactly similar to that of the "Cole" locomotive. but at 500 ft. per minute, the speed at which it showed the least water rate, the consumption was 17.5 lb., and at 1100 ft. this figure was increased to 19 lb. At the same speed the simple engine using saturated steam showed that it required just less than 24 lb. of water per indicated horse-power.

Superheating

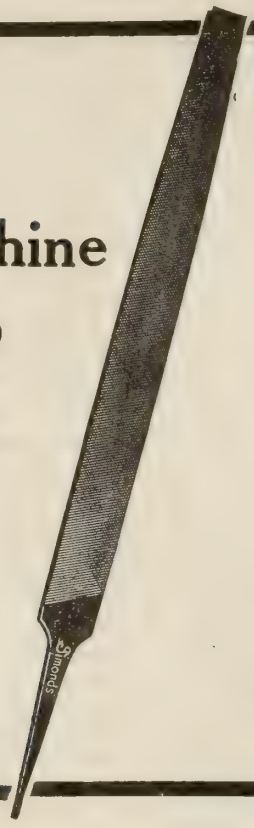
Since the introduction of the arch in the locomotive fire-box, no single improvement has, speaking generally, had such marked effects on the working of the locomotive from its economical aspect as the introduction of the superheater. Superheated steam has made the simple engine more economical almost throughout its entire range of ordinary working speeds than any compound experimented with on the St Louis plant. Comparing the water rate of the superheated "Hanover" compound with that obtained with the latest type of Pennsylvania "Pacific" type locomotive using superheated steam, the result show that at a piston speed of 800 ft per minute the water rate for the simple engine was 17.9 lb., that of the compound practically the same, about 17.7 lb., whilst at 1200 ft., 62 miles per hour, with 80 in. drivers, and 28 in. piston stroke, the water consumption of the simple engine was but 16.2 lb. against 19 lb. used by the superheated compound at 1150 ft. per minute, the highest speed at which that engine was tried. At higher speeds of 1400 ft. and 1600 ft. per minute, the simple engine gave 1 indicated horse-power for a water consumption of 15.6 lb. and 15.1 lb.

Enough has been said to show that compound engines, even if supplied with high degree superheated steam, will have to show a considerable improvement in water consumption amounting to at least 15 per cent. at the higher rates of speed before they can compete with superheated simple locomotives in express passenger service.

Superheated Compounds

From the fact that the water rate curves of both saturated and superheated compounds are generally alike in form, each displaying a similar increase in consumption with increase in speed, we gather that there is still room for improvement in the design and proportioning of compound locomotives, so far as the cylinder arrangement is concerned. Will the present pressing needs for economical working prompt designers to attempt again a solution of this interesting problem? We have on occasion seen it asserted that the express locomotive of the future will be a superheated compound, but considering the really wonderful results obtained with modern simple engines using highly superheated steam, we confess that at present we see no evidence of the re-introduction of the compound system into the practical politics of express locomotive design.

The Compounds on Goods Trains



So far we have dealt with express locomotives only. What is the position of the goods engine? Can we expect any economic advantage from the application of a superheater, and with it compound cylinders? In the United States practically all freight traffic is handled by simple engines equipped, of course, with superheaters. For very heavy "pusher" or assisting services, however, four-cylinder compound "Mallet" engines are the rule. These engines by the nature of their work operate at very low speeds, and thus appear suitable for compound working. As a result, some remarkably low steam consumption figures have been attained, and, as we write, we have before us the published results of trials made with a large compound "Mallet" built for service on the Norfolk and Western in 1918. This locomotive at 8.16 miles per hour gave an indicated horse-power for 15.21 lb. of steam; at 10.5 miles per hour, 19.4 lb.; and at 12 miles per hour, 21,2 lb. were required These speeds correspond to piston speeds of 260 ft., 320 ft. and 385 ft. per minute.

MONTREAL MARKETS

(Continued from page 45)

next few months, and this together with the business closed in the new field should make 1922 a good year for dealers in small tools and supplies.

Non-Ferrous Metals

The New York copper market has been strong the last few days and copper prices are up somewhat. There is not a great deal of additional business locally, although plants such as the Northern Electric Co. are taking on more men and are showing signs of an increasing amount of business. Tin quotations are also on the upgrade. Locally tin is bringing 37½ cents per pound. The fluctuations in tin do not always reflect business conditions regulated by supply and demand. Thus the present activity is rather hard to explain especially as far as any local business is concerned. Lead has also stiffened in price, and the London market is very firm. Lead is the only non-ferrous metal that is today above the pre-war price. Many consumers declare there is no reason for this. However, a demand exists, as is evidenced by the fact that a local firm had an inquiry for one thousand tons of Canadian Lead to be supplied to an Oriental country. As the metal was required immediately the company were unable to accept the order. Antimony, spelter and aluminum have not been very active the past week.

No further developments have occurred in the scrap metal market. The continued lack of business in foundries is responsible for the quiet scrap market. Quotations have been withdrawn for some time past, and there is little or no business moving.

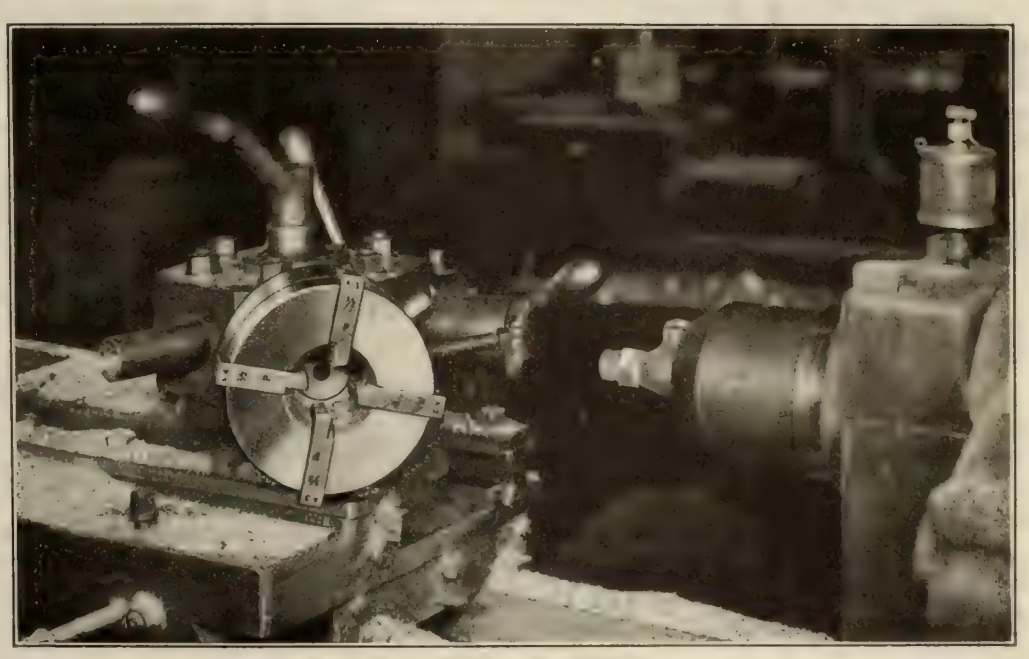
NEW PLANER

(Continued from last week)



Centralized lubrication is one of the features of this machine, but probably the most important part of this machine is the new gear drive provided. Helical gears are installed throughout from pulley shaft pinion to table rack. It is a well known fact that helical gears produce end thrusts.

Advantage is taken of this fact by arranging the rack so that the end thrust of the bull gear and pinion, which amounts to about one-tenth of the driving force, opposes and compensates for the side thrust of the cutting tools when they are being fed away from the operator's side of the machine a condition which obtains at least 90 per cent. of the time. As the tool pressure increases the balancing thrust of the bull gear and pinion increases in proportion for more power is required to drive the table. This equalizes the pressure and wear of the two sides of the V's, and overcomes the tendency of the tools to push the table up the side of the V's. The diameters and helical angles of the remaining gears of the train are so proportioned that their end thrusts very largely balance one another. Bronze thrust collars, provided with forced lubrication, take the slight residual end thrusts.

Planer work is usually placed close to the operator's side of the machine. The rack is therefore placed slightly to the operator's side so that the driving force will coincide as nearly as possible with the line of action of the cutting tools. Particular attention is called to the unusual midth of the helical table rack, which gives great strength. It is cut with a very low pressure angle. This greatly reduces the tendency of the bull gear to lift the table. In order to obtain maximum stiffness the gears are keyed on the pinion hubs thus relieving the shafts of all torsional strain. To insure correct tooth action, the teeth are cut by the generating process to true involute forms, and to obtain great smoothness of action and stronger teeth, the pinion teeth are so cut that the greater part of the tooth face lies outside the pitch circle. The teeth have a low pressure angle, are cut full depth, and have a short arc of approach and long arc of recess, giving high efficiency, and greatly increasing the number of teeth in contact and the smoothness of action. This design has the advantage of permitting the use of pinions of larger diameters and stronger tooth form In other words, the special form of tooth is distinguished by its full length low pressure angle short arc of approach and the very long angle of action. The last is said to greatly increase the number of teeth in simultaneous contact; reduce the specific pressure at the lines of contact; long life and quiet operation, and produces work of accuracy.

Right in the Lead

A Busy Corner Of A Notably Successful Shop

The Geometric Die Head illustrated has just cut the ½ in. pipe thread on the bibb shown. The equipment of this shop consists of many standard and special Geometric Tools.

These people express themselves as very strong for the Geometric line, and are always glad to recommend the use of these Tools. They have themselves used Geometrics for a great many years.

If you can find a user of Geometric Screw Cutting Tools who is not satisfied with them, you will do us a great favor by telling us who he is and where we can find him.

CLOSING TIME

Advertisements for this section must be in our composing room Tuesday morning prior to day of issue.

In order that the announcements of your wants, machinery for sale, etc., etc., shall not be delayed, please try to have them in our office with the Tuesday morning mail.

Canadian Machinery

REGO WELDING *and* CUTTING APPARATUS

Oxygen, Acetylene, and a complete line of Welding and Cutting Supplies.

Carter Welding Co.
of Toronto, Limited
7-11 Sheppard St., Toronto, Ont
Phones: Adelaide 2841 and 1524
(TF)

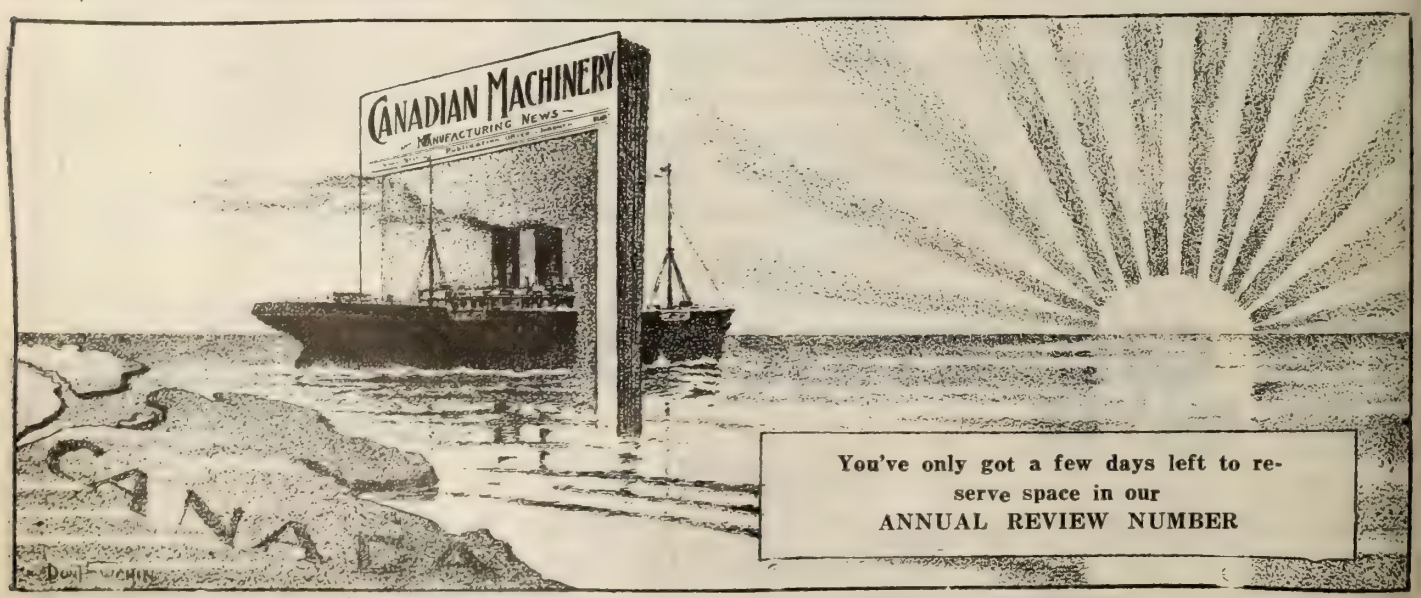
PATTERNS

TORONTO PATTERN WORKS, 65 JARVIS Street, Toronto. Patterns in wood and metal for all kinds of machinery. (etfm)

BRANTFORD PATTERN WORKS ARE PREpared to make up patterns of any kind—including marine works—to sketches, blue prints or sample castings. Prompt, efficient service. Bell 'Phone 631: Machine 'Phone 733. Brantford Pattern Works, 49 George St., Brantford, Ont. (etfm)

Machinery Wanted

Advertisements under this heading will be inserted once free of charge. Readers are invited to use this department when in need of equipment. Replies may be sent to box number, care of Canadian Machinery, if desired.



WE ARE ANXIOUS TO SECURE THE FOLlowing:
3 spinning lathes, 28" swing, 6 ft. bed; 3 buffing spindles; 2 foot presses with deep throat for rivetting; 1 automatic rivetting machine with deep throat, 25 to 30 h.p. motor, alternating current, 550 volt; Rotary shear; 1 double action toggle press 12 to 16" stroke, 30 in. between uprights. Quick action requested. Box 797T, Canadian Machinery.

MACHINE WORK WANTED

MACHINE WORK WANTED FOR LATHES, shapers, milling machine and planer, etc. Hourly or contract basis. Prompt delivery. W.H. Sumbling Machinery Co., Toronto. (etfm)

Grey Iron Castings

Light and Medium-Bench and Floor Repetition Castings; Capacity 15 tons per day.
Expert Metal and Wood Pattern Work. Our advice and estimates will save you money.
Semi-finishing operations on Lathe or Grill on Castings supplied if required.
ASK US.
THE KATIE FOUNDRY, GALT, ONT.

Canadian Machinery BUYERS DIRECTORY

If what you want is not here, write us, and we will tell you where to get it. Let us suggest that you consult also the advertisers' index—last page of book, after having secured advertisers' names from this directory. The information you desire may be found in the advertising pages. This department is maintained for the benefit and convenience of our readers. The insertion of our advertisers' names under proper headings is gladly undertaken, but does not become part of an advertising contract.

DIRECTORY OF DEALERS

THE Buyers' Directory of CANADIAN MACHINERY was originally intended to contain information regarding lines actually manufactured by our advertisers. We now carry the advertising of leading machinery dealers, some of whom represent scores of manufacturers in addition to being manufacturers themselves in some cases. This necessarily widened the scope of our Directory, but it would be impracticable to list all the lines handled by all the dealers. We recommend, therefore, if our subscribers cannot find what they want in our Directory that they communicate with the dealers whose names appear herewith.

Free Tool Grinding Chart

Grind your cutting tools in exactly the right way to get best results—and you save time. That's obvious. It is precisely that that this Tool Grinding Chart enables you to do.

It has been adopted as standard by many firms that found it a long way better than guess work.

CANADIAN MACHINERY would like to see this Chart in every shop in the Dominion. Mail the coupon below for your copy to-day.

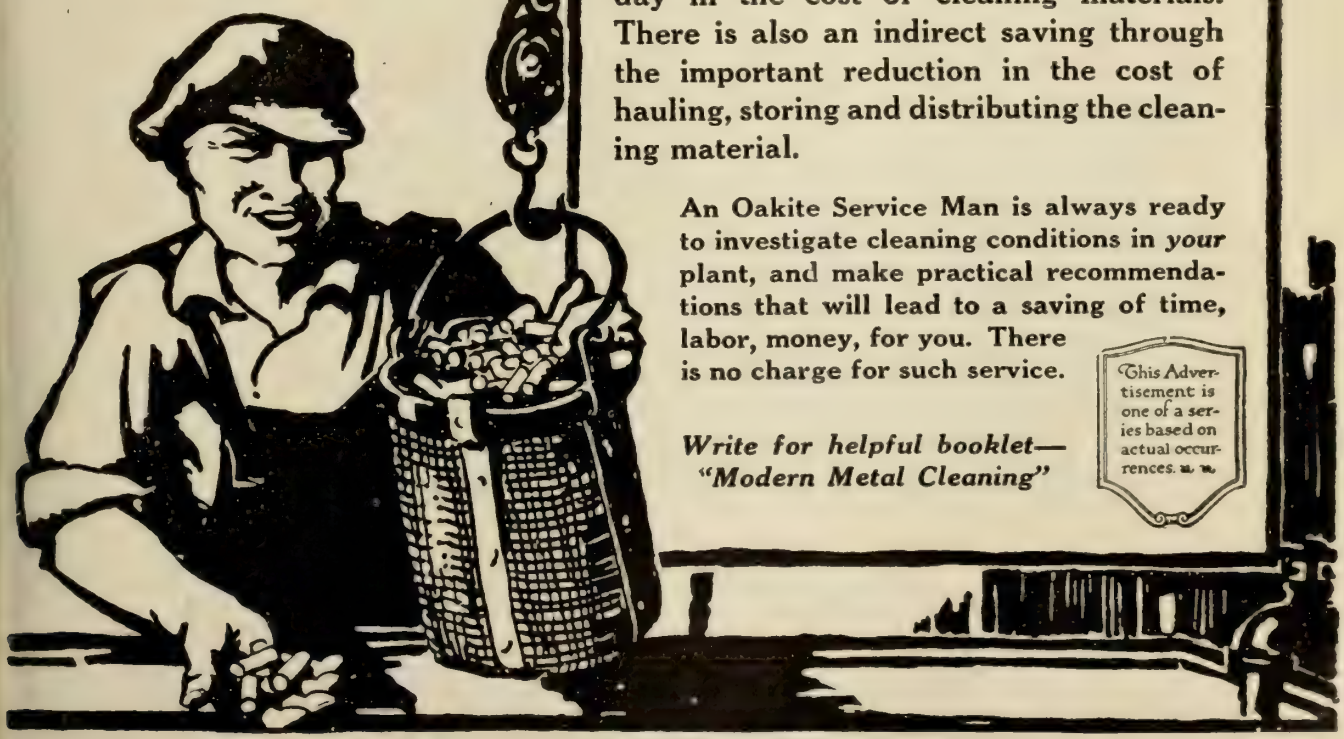
Cleaning Costs Cut $6.74 a Day Since Using Oakite

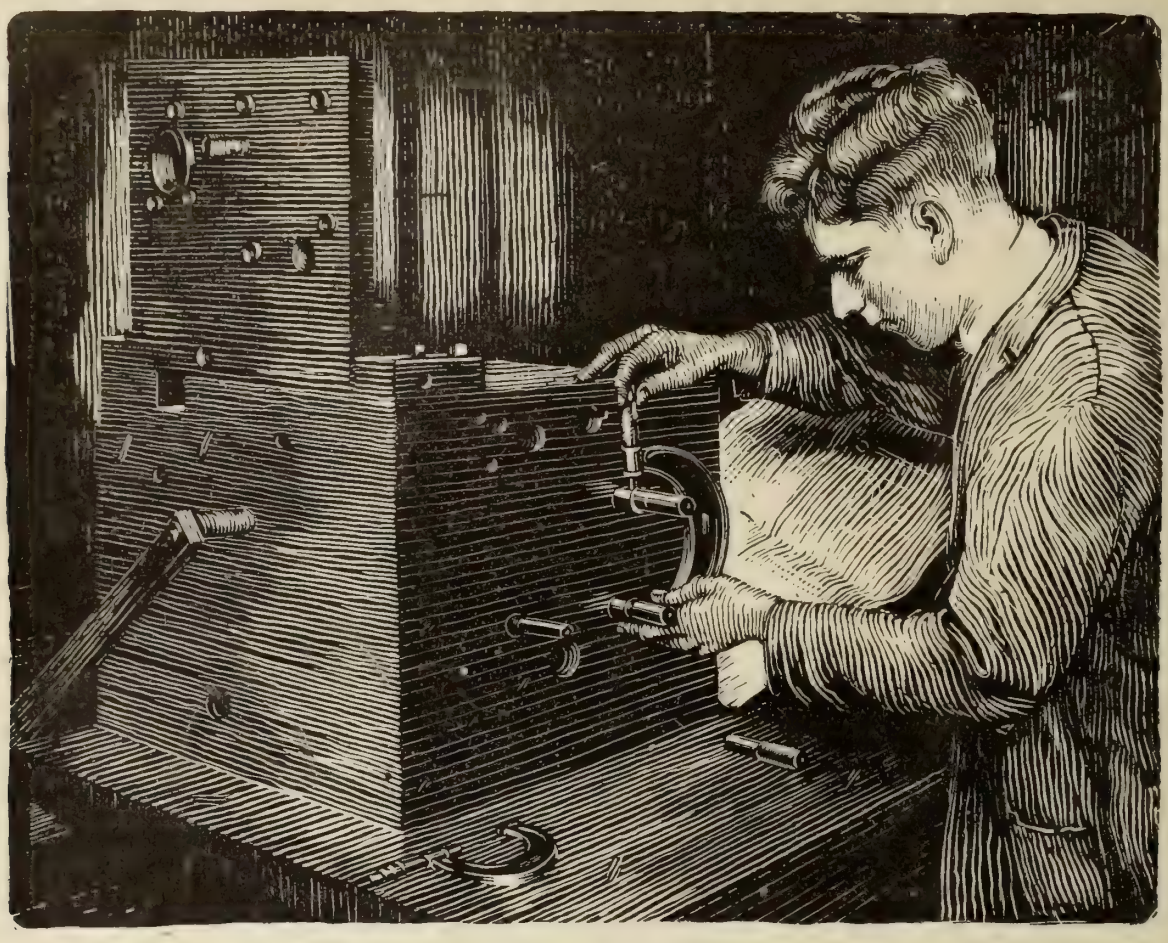
A PLANT making steel horseshoe calks now uses Oakite materials (O.P.C.) for cleaning before dry-threading, because *pounds* of O.P.C. are doing the work of *barrels* of sal soda.

Formerly made up cleaning tank fresh every day and used 280 lbs. sal soda. With O.P.C. only 28 lbs. were required to make up the tank, and the daily upkeep of the tank is maintained by the addition of 14 lbs. O.P.C.



This results in a direct saving of $6.74 a day in the cost of cleaning materials. There is also an indirect saving through the important reduction in the cost of hauling, storing and distributing the cleaning material.

An Oakite Service Man is always ready to investigate cleaning conditions in *your* plant, and make practical recommendations that will lead to a saving of time, labor, money, for you. There is no charge for such service.



Write for helpful booklet—
"Modern Metal Cleaning"

· EASY TO USE ·

Machinists who lay out and check up metal-working jobs requiring extreme accuracy find Starrett Tools an invaluable aid to speed as well as precision.

The simplicity and positiveness of their adjustments make accurate work easy.

And those adjustments are so designed as to retain that positiveness and accuracy through long, hard service.

Through constant demonstration of this practical superiority in every day metal-working service, Starrett Precision Tools for many years have gained an ever increasing preference and prestige among men who know fine tools.

Catalog No. 22 "3" featuring 2100 Starrett Tools—will be sent free on request.

CHEER UP

THERE'S OCCASION FOR OPTIMISM

The Elections are over.
The Irish Question is practically settled.
The Washington Conference will do a World of good to this good old World.
"The Annual Review Number" of CANADIAN MACHINERY will be issued December 29.

A YEAR FOR GO-GETTERS

The coming year will be what we individually and collectively make it. If we sit back and wait for business, business will sit back and wait for us. If we go out boldly, determined to get business, business will come.

If we tacitly admit by our attitude that we do not expect our salesmen to get business they will not get business. On the other hand, if, by a forward policy, involving aggressive sales and advertising effort, we make our salesmen feel that we believe business can be secured and that we expect them to get it, THEY WILL GO GET IT.

Are we to throw cold water on our salesmen next year, or are we going to inspire them, and enthuse them, and imbue them with the idea that they can get the business? It's for you to say.

Are we going to intimate to the trade by our attitude that we do not expect the trade to buy? That would be fatal. Or, are we going to set a fine example by declaring our confidence and faith in no uncertain way? That, too, is for you to say.

One way of saying it is to present your sales message in the "Annual Review Number" of CANADIAN MACHINERY—December 29.

This year's number will be a gallery of leaders, a "who's who" of optimists, a directory of firms who are going after business in 1922. Give your salesmen the encouragement and inspiration they need. Tell the world you are out after your share of the business.

Reserve your space to-day. With a stroke of your pen you can make easier the road to bigger business next year.

STAYBOLT TAPS

The Better the Man, the More He Appreciates Them—

Not only good when new, but heat treated and seasoned to maintain this goodness. Can be ground on face of cutting edge without affecting their size. That's why you'll find Pratt and Whitney Stay Bolt Taps on the job long after cheaper, "just as good" tools are buried in the scrap pile.

Threads accurately and cleanly cut, with the least expenditure of time and effort, are other reasons why these better Taps are favorites in the shop.

If you've used them before, you know just how good they are. If you haven't, send us your first order—we know you'll be back for more. They're carried in stock in our sales rooms in all large cities.

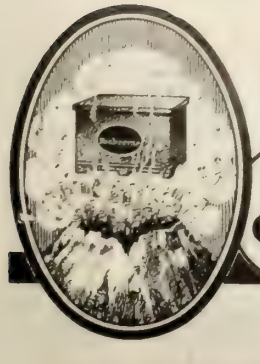
HULL, Quebec

Winners!

WINNER—because the vital parts are equal to the strain of terrific speed. A soft spot in the case of the crank shaft or other case hardened parts and the chance of victory, of reputation and prestige would be little more than a dream—perhaps a pile of twisted wreckage.

So it is with Carbonizing Containers. The kind that retains its original shape and form in carbonizing temperatures reduces spoilage and fuel consumption, gives more heats per dollar and more uniform results. All these advantages come with the use of Cast Nichrome Containers, plus a guaranteed life of thousands of hours at 1800° F. The proof is in hundreds of plants. Cast Nichrome Containers may be had in hundreds of stock pattern sizes—or in special designs for special requirements.



Manufactured under Henderson Patents.

HEALD

Jigging Cylinders In Jig Time

Heald Style No. 65 is heavy and massive, with numerous speeds and feeds and when equipped with the universal jig is ideal for regrinding purposes.

One of the many advantages of a Heald machine for regrinding auto cylinders is illustrated above showing our new universal jig which we furnish with all machines to give quick set-ups maintaining the highest production.

An operator only has to measure the hole to be ground, set the top bar so the locating mark will register the proper diameter in inches, and lift the cylinder up on the locating rods, having one in each end hole. After strapping the block in place he removes rods, pushes the bars out of the way and is ready for grinding. What could be simpler?

With many other conveniences to assist the operator, together with a design and workmanship which for 16 years has stood the test of time, leaves little doubt that the Heald is the only machine for this class of work.

Remember also the Heald Service which is one of those intangible things that comes unseen with the machine but which, when once given, is of inestimable value to all and particularly a new concern. It cannot be measured in dollars and cents but is a valuable asset to be considered.

There are so many other salient reasons for the purchase of a Heald Machine for regrinding that only a personal visit or a volume of literature will tell it all.

Let us get together today—now—Write, wire or even a phone will start success in your direction.

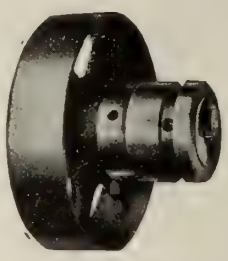
THE JOHNSON FRICTION CLUTCH

Install a Johnson Lineshaft Drive

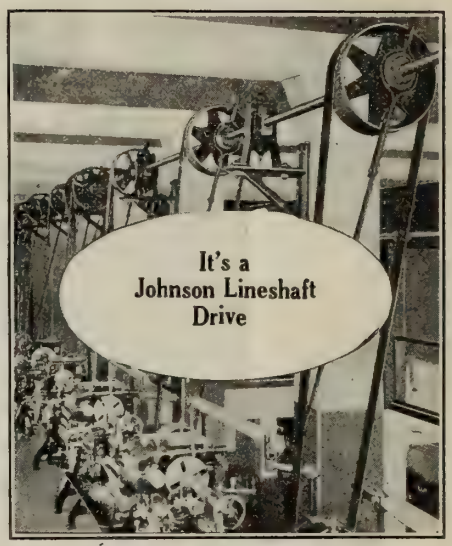
The practical experience of hundreds of our customers has established their belief in the Johnson Clutch Drive as the ultimate method of power transmission.

It replaces the countershaft, with its old fashioned tight and loose pulleys, and its troublesome overhead belting.

It avoids the expense of individual motors, and the waste of current they involve.



It substitutes reliable clutch control—economical in first cost, efficient in operation, durable under all kinds of service.



Friction Control Means Better Machinery

We specialize in friction clutches alone and can supply the right clutch for any drive. Hundreds of standard sizes in stock to fit all shaft and pulley dimensions.

"We are still using Johnson Clutches with very good success and have had them installed in our Nut Tapping Department for about ten years and at least half of that time they have been running night and day. We are also very greatly pleased with their operation in direct drives from lineshafts to lathes and other machines in our Machine Shop Department."

The National Screw and Tack Co., Cleveland, Ohio.

An installation made ten years ago on American Tool Works Lathes. Still in perfect condition.

MADE IN CANADA

WILLIAMS' SUPERIOR
DROP-FORGED HAMMERS
Are dependable tools because:—

Their heads, drop-forged from a special grade of tough steel, carefully hardened and tempered, neither crack, chip nor splinter.
They are fastened most securely and solidly to the handles—can't work loose—can't fly off.
Their handles are made of the best grade of clear, straight-grained hickory, flared at the grip to prevent hand-slip.
The weight and length of each tool are properly proportioned to give perfect balance, and, hence, increased striking power.
Williams' quality Hammers of all kinds and sizes. Catalog on request.

Ventilators of Lasting Efficiency

Made of Robertson Process Metal

Rust and corrosion are the enemies of ventilator efficiency. They quickly render ordinary ventilators ineffective. But Robertson Ventilators are rust-proof and corrosion-proof. They are constructed throughout of Robertson Process Metal, a building material whose three protective coatings (1) Asphalt (2) Asbestos and (3) Waterproofing enable it to withstand the corrosive influence of moisture, fumes, gases, smoke and other metal-destructive agents.

Robertson Process Ventilators give maximum ventilating efficiency under any and all conditions of wind and temperature. Robertson deflecting devices, scientifically designed and coordinated, catch the wind from above, below or any angle and utilize it to create a suction which draws the air out of the building. They eliminate the possibility of back draft. Robertson Ventilators exhaust to full capacity when there is hardly a perceptible movement of air. They function equally well when a gale is blowing.

Further advantages of Robertson Process Ventilators are described in an illustrated bulletin which will be gladly sent upon request, together with an actual sample of Robertson Process Metal.

Every Tap User Can Double Production

by replacing carbon tool set ups with

MURCHEY SOLID ADJUSTABLE TAPS

Besides enabling the machine to be operated at twice its former speed, MURCHEY SOLID ADJUSTABLE TAPS are economical! Economical because the high speed chasers with which they are equipped cost no more than solid carbon tools yet actually cut **five times as many threads.** A fact worth looking into, isn't it?

The adjustable feature enables the chasers to cut full size until they are entirely used up. Then it's a simple matter to order new ones.

May we send you trial samples?

Prest-O-Lite

DISSOLVED ACETYLENE

THIS pulley was cut and the frozen shaft removed in perfect condition—one of hundreds of successful operations of the oxy-acetylene process being daily effected in machine shops everywhere.

Prest-O-Lite Dissolved Acetylene has made the welding and cutting blowpipes available **anywhere** by supplying uniformly pure gas in easily portable and instantly accessible cylinders—a system of distribution so flexible to meet perfectly every possible demand.

A centrally located chain of plants and warehouses forms the ground-work of Prest-O-Lite Service, the operation of which insures a never-failing supply of Prest-O-Lite Dissolved Acetylene in any quantity at any place.

THE FIRST PRECISION TOOLS IN AMERICA

1867
"The Pocket Sheet Metal Gauge." The first Micrometer Caliper in America — over 50 years ago — a Brown & Sharpe product.

1851
The first and original Vernier Caliper, so far as is known, invented by Mr. J. R. Brown in 1851—over 70 years ago.

WHEN Joseph R. Brown of the Brown & Sharpe Mfg. Co. gave the world the invention of the Vernier Caliper, he established, 70 years ago, a World-wide Standard of Accuracy. In 1867, Mr. Brown and Lucian Sharpe introduced, in America, the first Micrometer Caliper. The steadfast and satisfactory performance of these fine tools is a tradition maintained and protected by the conscientious efforts of skilled workmen.

BROWN & SHARPE MACHINISTS' TOOLS

represent the accuracy and fine workmanship which only pride in product and experienced master craftsmen can accomplish.

When productive and efficient accuracy are as requisite to industry as now—when extreme caution is used to select the best equipment—Brown and Sharpe Machinists' Tools warrant the special consideration of the prospective purchaser.

See these superior tools in our Catalog No. 28—send for it to-day.

A Brown & Sharpe Machinists' Tool, perhaps in a Morocco Case, admirably expresses, as a gift, the Spirit of the Yuletide.

Five Examples Of Efficient Punch Press Work

Progress Made in Die Construction Has Been Wonderful—Making Die with Narrow Slot—Trimming Die for Drip Spout—Shearing Die for Same Piece—Combination Can Top Die

BY J. H. MOORE

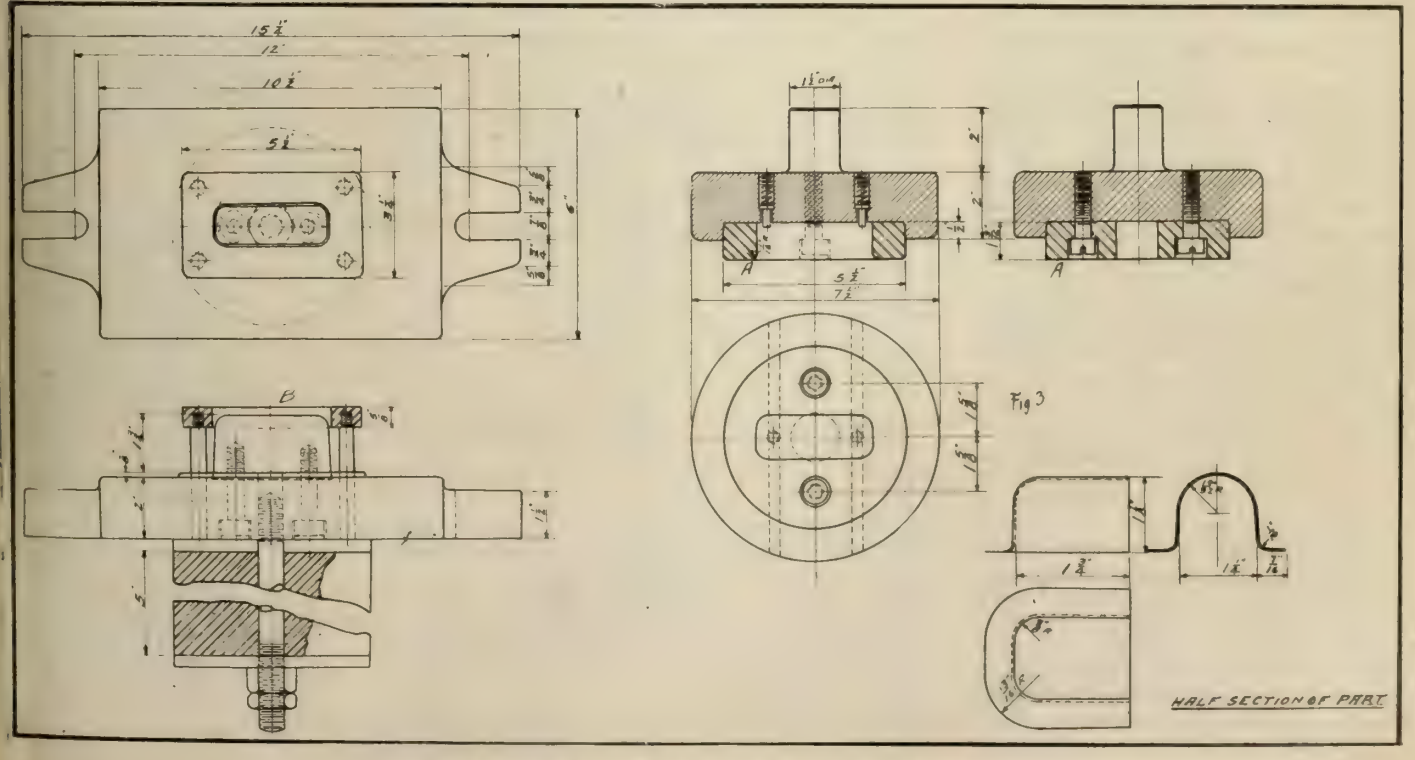
INDUSTRY owes a great deal to the designers responsible for the advancement of punch and die practice in general. The progress made has been nothing short of marvellous, operations being performed in manufacturing plants that were considered absolutely impossible a few years ago. In place of two, and even three operations, pieces are now being turned out at one stroke of the press, and it would seem as if every victory over a difficulty, makes designers all the more determined to master some further manufacturing problem. Compare present day practice with the time when punching was a comparatively new art and what do we find?

Instead of grinding a die by means of a carefully selected grinding wheel, the old timer had to use emery to finish grind his dies. Mr. J. M. Brown, of the Brown & Briggs, Ltd., Hamilton, Canada, told the writer some very funny experiences of making dies in the old days, which shows what these all around mechanics were up against. In fact, when some of the points are viewed alongside of the up-to-date dies shown in this and which have all been made by the company with which Mr. Brown is associated, it illustrates clearly how things have progressed in this special line.

Mr. Brown is firmly of the opinion, that while the art of making dies has improved, the class of workmanship is not as good as it was in the earlier period. In those days a tradesman was an all round mechanic. He could handle any machine efficiently, and on bench work was nothing short of a marvel. Occasionally you came across a poor specimen, but such a man was the exception rather than the rule. The blacksmith often had a large part in the making of the die, but here again he was an all round man who know his trade, and the machinist trade, pretty thoroughly.

The class of machine tools were none of the best; die sinking machines did not exist, and as for magnetic chucks on which to hold small or large die sections while grinding, such a thing was never thought of. All things considered, it is surprising they made as much progress as they did. The good ideas were not all thought out on the draftsman's stool, or in the manager's easy chair according to Mr. Brown, for in many cases improvements took place due to accidental discovery. However, progress was made, which is the main thing, and although Mr. Brown is a modest executive, and did not care to admit it, he half-confessed that even in those days, as at present, many came to him seeking advice on die practice.

It's the little things that count in die work. Take for example the sketch at Fig. 1. Suppose you had a narrow slot to make in a die block as shown, how would you proceed? Would you drill



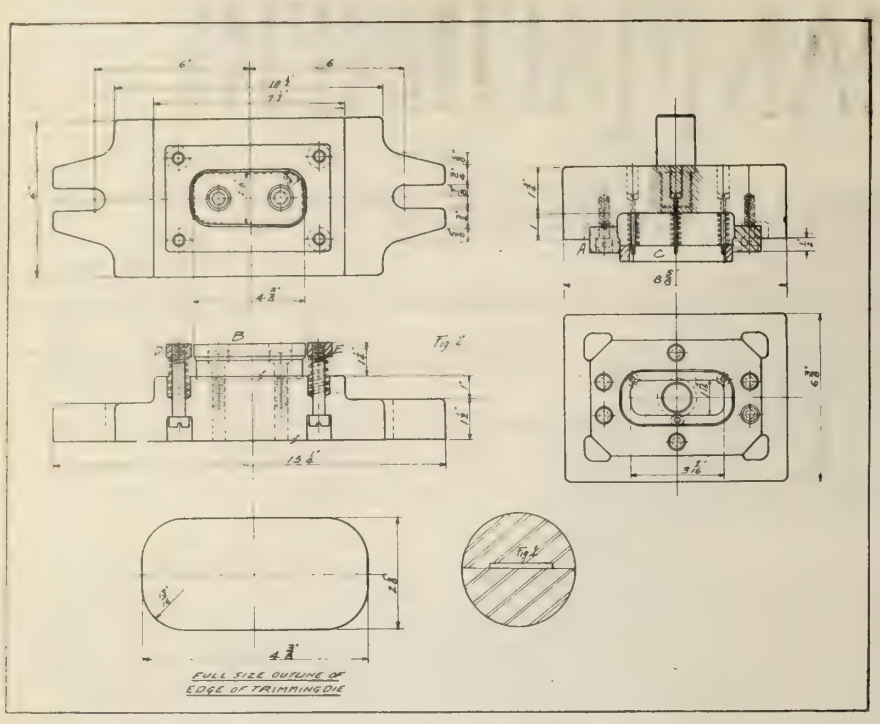


Fig. 3—Details of drawing die used to produce drip spout.

Figs. 1 and 2, showing trimming die; also method of making narrow slot die.

a series of small holes, then file the slot? Ten chances to one you would, and if so you would be doing exactly what the Brown & Bogg Co. did, until they suddenly decided the method shown at B was much better and quicker. They made an insert in two parts, and were thus able to machine the slot on the shaper, getting it to very close limits, and arranging for necessary clearance without trouble. Without further preamble, we will consider some dies which have proved real production assets. No attempt will be made to confine examples to any particular style of die, but we shall show as varied an assortment of ideas as possible in this space.

Making Drip Spouts'

In Brantford, they make an electric washing machine which is known under the trade name of "Bluebird." On this machine is a drip spout which is made from steel stock fifteen thousandths of and inch thick. After due consideration, it was decided to make these spouts two at a time, the last operation being splitting or shearing them apart.

Fig. 2 shows the trimming die used on the blank for the spouts, and it will be noted that the die is really the portion A, while the punch is the part B. In action here is what transpires. Upon reaching the work the stripper plate C comes down and grips the stock securely. As the ram further descends, the plate C pases up inside the die or punch A, (call it what you will) This A. die upon reaching the two plungers D. and E. proceeds to depress them sufficiently to allow the trimming of the blank. Upon the ram ascending, the stock is automatically stripped, as the two plungers mentioned come up to their proper level. This method of manufacture has been found very satisfactory, flat and accurate blank being obtained. As the size of blank is clearly shown, together with important dimensions of die, we can pass on without further comment to Fig. 3, which shows the drawing die for the same piece.

The separate view shows a half section of the spout, and as will be noted the punch A is held in place by means of two filister head screws. On the ram descending the punch A hits the plate B, depressing this until the stock is drawn over into the shape shown. The rubber stripper then relieves the part as the ram ascends.

Next comes the shearing operation, the parts now being separated. The piece goes over the horn as shown in lower bolster, at Fig. 4, then the shear B descends with ram and cuts the spout in half. As the shear blade is clearly shown in the lower view we need not dwell on any detail in connection with the dies' construction.

Can Top Die

The remaining illustration Fig. 5 shows a very interesting die which was designed to make penny lever can tops in one operation. The section of the shape formed is shown in separate view. As this die is of a very special nature we will take up each point in detail. First, note the careful design, the compactness of the various members, and how each part performs an important function. Suppose the stock to be in place and the ram on its way down. First, the punch A cuts out the center hole, the rubber stripper being strong enough to resist this pressure. Upon traveling further, the punch A, at surface B, hits the level C of center lower die. This causes the center lower die to move downward guided in forming block D, this in turn causing the portion of can top sticking over edge of block D to be drawn down into shape. As the ram still further descends the block E, coming within a distance equal to the thickness of the stock, causes the can top to take on the form shown. Before this occurs however, the blank has been punched on its outside diameter, and on completing its stroke, the ram, aided by the portion F, pushes down the sliding block G. This latter movement causes the can top to have its outside edge drawn down as shown.

The section of shape formed is slightly different from the die itself, but as we

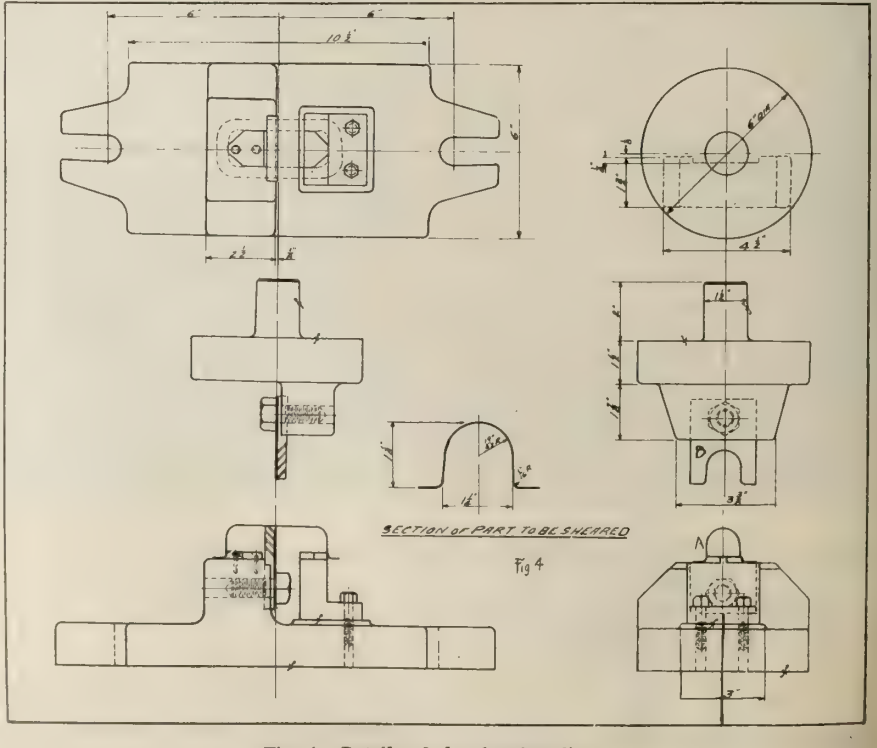

Fig. 4.—Details of the shearing die.

could not at the moment secure a can top produced by the die, we illustrated the section of another shaped form. This was done with a double purpose, viz, to show that the same principles embodied in this die, are used to produce different styles of can tops. In a later article we will show further examples of modern dies as designed and made by the previous mentioned firm.

WHY BELTS ARE STIFF

An excellent way in which to make a study of belt fibre action is to take a pad of scratch paper, a magazine, or something of that sort, and bend it. It is easy to bend a pad of paper when the motion of the ends of the paper is unrestricted. You will note that one sheet slips along on the other a short distance. There is no tension on the convex side, or compression on the concave side of the bent pad. Glue the ends together, or hold the ends tightly with the hands, however, and it will be found more difficult to bend the pad. There will be a "buckling" on the concave side. The convex side will be in tension.

Next glue the complete pad together by saturating it in glue and drying, and you will have a chunk of material that will be as difficult to bend as cardboard, or even as difficult as wood. This is because buckling becomes impossible on the concave side if the gluing job is properly done, and there is no sliding. There is a certain plane close to, or at the centre, that is neither stretched nor compressed when the "board" is bent. That plane is called the "neutral axis." On the concave side of that axis the fibres of the board are in compression. On the convex side the fibres in tension.

The thicker the board the greater the force required to bend it. This is true because the fibres farthest away from the neutral axis have a longer level arm than in a thinner board. And that is why I-beams, channels, Z-bars, etc., are made for engineering structures—to put the outside steel fibres as far away as practicable from the neutral axis.

This explains why belts may be stiff or pliable. The dry, hard belt that is not lubricated in its fibres is naturally stiff because the fibres have difficulty in rubbing one over the other. Thus you will find it more difficult to bend a pad of sand paper or emery paper, for example, than a pad of smooth writing paper. The dry, hard belt does not permit its fibres to slide on one another so easily on the tensile side nor on the compression side. The treated lubricated belt on the other hand, permits its fibres to slide with greater freedom. There is no "grinding" as in a pad of sand paper.

This method of studying the belt will clear away many of the points that have possibly been troubling many belt users. It explains why double or threeply belts are stiffer than single belts. It explains why treated belts are more pliable than untreated belts of the same thickness. It shows why lapped cement joints have a tendency to loosen or "shear" and why the cement used in any belt must be good. Pick up a pad or magazine one-fourth of an inch thick and try it.

This brings to the front the question of belt dressing. Our advice is to use the dressing recommended by the manufacturer. There is no need for you to experiment. He has done so for you. If you use his experience you will probably save a lot of time as well as save your belt.

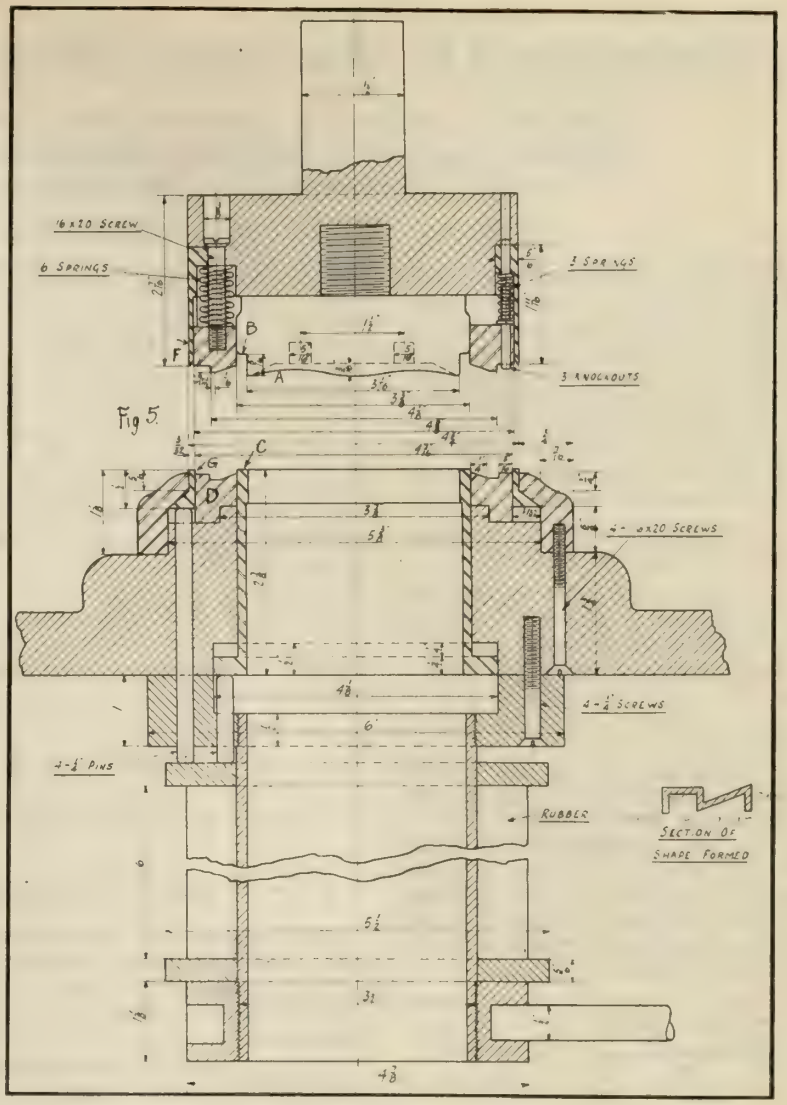

Fig. 5.—Details of the combination can top die.

NEW TYPE OF FLOW METER

Many ingenious devices have been invented to measure the rate at which water or other fluid is flowing along a pipe. A simple and most effective type is now produced by a British firm of instrument makers. The essential part of the instrument is a small paddle wheel placed inside the pipe so that it rotates as the fluid moves along. This paddle wheel has attached to it a magnet, and in a separate steel chamber immediately outside there is another magnet which rotates like the first. When the paddle wheel moves and carries its magnet round with it, the movement of the magnet pulls the second magnet round; and the speed of this second magnet therefore indicates the ratio of the flow in the pipe. The advantage of this arrangement is that the indicating part of the mechanism is quite distinct from that through which the fluid is passing. All risk of the fluid finding its way into the indicating chamber is avoided, and the instrument is therefore particularly well suited for use where crude or hot oil is employed. The makers suggest that this instrument is well adapted to measuring the rate of flow of oil in lubricating systems, and also the flow of oil fuel or cooling water in oil engines.

The Georgetown Foundry and Machinery Co., of Georgetown, Ont., report a steady increase in sales. Business took an upward trend two months ago and the past month's sales have been greater than any previous month. This is the statement made by the manager of the above company to the correspondent of Canadian Machinery.

Elements Of Machine Design—Lesson No. 4

Eccentric Loading Is Cause of Many Failures in Structures — Typical Cases of Eccentricity—Methods of Solution for Determination of Stresses—Eccentricity in an Angle Connection

*By L. T. RUTLEDGE

ONE OF the many causes of failure in various structures is eccentric loading for which no provision has been made in the design. In some cases, the eccentricity is not very apparent and consequently often ignored. The purpose of this discussion is to illustrate typical cases of eccentricity and to provide methods of solution for determination of stresses.

1. Eccentricity of Loading on a Short Post or Compression Member:

In Fig. 17 is shown the plan and elevation of a short post loaded on its top surface with a concentrated load "P." The point of application of the load is distant "e" from the vertical axis of the post as shown. The eccentricity is therefore equal to "e."

The eccentricity of the load causes an unequal distribution of stress. The compression is greater on the side on which the load is located, that is, on the right hand side. Let f_1 and f_2 be the stresses on the right hand and left hand sides respectively as is shown on the stress diagram, the elevation in Fig 17. The average stress is

$$\frac{f_1 + f_2}{2}$$ so that

P=average stress x area of the section

$$\text{or } P = \left(\frac{f_1+f_2}{2}\right) bd \quad -(24)$$

In addition, we know that the moment of the force P about the vertical axis is equal to the sum of the moments of all the stresses from f_1 to f_2 about the same axis. Now the sum of all the individual stresses is given by the area of the stress diagram.

To make use of the equation of moments, assume an infinitely small area.

ΔA of width Δx

distant x from the axis and assume the unit stress on this area to be "f." The strip is so narrow that the stress is uniform over it. The area

$$\Delta A = b \Delta x$$

and the total stress on it is

$$f b \Delta x$$

The moment of this stress is

$$f b \Delta x \, x$$

There are an infinite number of these strips and moments, therefore the total moment of all the stresses is the summation of all the

$$f b x \Delta x$$

This is expressed mathematically thus

$$\sum f b x \Delta x$$

So that, for equilibrium, we have

$$Pe = b \sum f x \cdot \Delta x \quad -(25)$$

The quantity b is a constant and may be passed through the summation sign, all the letters to the right of the summation sign standing for variable quantities.

Now the area of the corresponding strip on the stress diagram is

$$f \Delta x$$

and the moment of this area is

$$f \Delta x \cdot x$$

The total moment of the entire stress diagram is therefore

$$\sum f x \Delta x$$

Thus

Pe=b x moment of stress diagram about vertical axis.

The stress diagram consists of the rectangle A B C D and the triangle C D E. The moment of the rectangle about the vertical axis is zero since its lever arm is zero, its centre of gravity being on the axis. But the centre of gravity of the triangle is $\frac{d}{3}$ from the base or $\frac{d}{6}$ from the axis.

Therefore the moment of the triangle equals its area x $\frac{d}{6}$ or

$$\frac{1}{2}(CE \times CD) \times \frac{d}{6}$$

which is

$$\left(\frac{f_1 - f_2}{2}\right) d \times \frac{d}{6}$$

Thus, we have

$$Pe = b \left(\frac{f_1 - f_2}{12}\right) d^2$$

$$\text{or } Pe \left(\frac{f_1 - f_2}{12}\right) bd^2 \quad -(26)$$

From equation (24) we have

$$\frac{f_1 + f_2}{2} = \frac{P}{bd}$$

and from (26)

$$\frac{f_1 - f_2}{2} = \frac{6Pe}{bd^2}$$

adding, we get

$$f_1 = \frac{P}{bd} + \frac{6Pe}{bd^2}$$

$$\text{or } f_1 = \frac{P}{bd}\left\{1 + \frac{6e}{d}\right\} \quad -(27)$$

Subtracting the above equations we get

$$f_2 = \frac{P}{bd}\left(1 - \frac{6e}{d}\right) \quad -(28)$$

Now if e=o, that is, if there is no eccentricity, then $f_1 = f_2 = \frac{P}{bd} = \frac{\text{load}}{\text{area}}$, the old familiar formula. If $e = \frac{d}{6}$, then we have

$$f_1 = \frac{P}{bd}\left\{1 + \frac{6d}{6d}\right\} = \frac{2P}{bd}$$

and f_2=0.

So that the stress on the extreme fibre is twice the value it would have for a non-eccentric load and the stress on the extreme left fibre is zero. If the eccentricity is greater than $\frac{d}{6}$, we have increased compression on the right

*The author is Professor of Mechanical Engineering at Queen's University, Kingston, Ont., and should any reader wish help in any problem on mechanical matters, Mr. Rutledge will be only too pleased to offer assistance. To save time, write direct to Kingston, explaining your trouble in detail.

side of the load and at the extreme left the stress will be a tensile stress. It is quite apparent from these calculations that for the stable equilibrium the load must be placed within the middle third, that is within $\frac{d}{6}$ to the right or $\frac{d}{6}$ to the left of the axis.

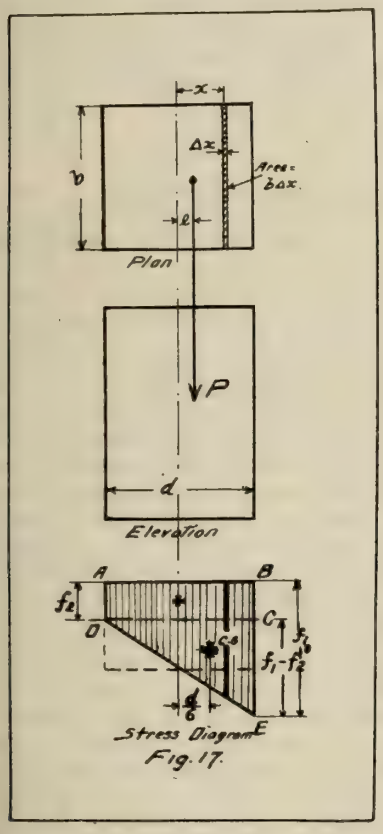

Fig. 17.

2. Eccentricity in an Angle Connection

A very common method of connecting a single angle, in tension or compression, is shown in Fig. 18. The connection of the angle to the gusset plate, where the connection is made to one leg only, will cause the angle to be loaded eccentrically. The stress resulting from the load is very much increased over the value it would have due to central loading, by reason of the aforesaid eccentricity. The solution of a concrete problem will best illustrate the method of procedure for the determination of the value of the stress involved.

Let it be required to determine the size of angle and the number of rivets for a connection similar to that illustrated in which the load P, causing tensile stress in the angle, is 20,000 lbs. Assume that the allowable working stresses in tension, bearing and shear are 16,000, 20,000 and 10,000 pounds per sq. in. respectively, and take the thickness of the steel gusset plate as ⅜ inch.

The net area of the cross-section of the required angle, if eccentricity is ignored and central loading assumed is the total load divided by the unit stress, or $\frac{20,000}{16,000}$ which gives 1.25 sq. ins. as being necessary. This condition will be satisfied by the selection of a 3 x 3½ x 5/16 inch angle, whose gross area is 1.63 square ins. and whose net area is 1.38 sq. ins., after making due allowance for the metal removed in one rivet hole. But considering eccentric loading it will be apparent that a larger section will be required to keep the unit stress below the maximum value of 16,000 permitted in the specifications. For a first trial, select a 3½ x 3½ x ⅜ inch angle which has a gross area of 2.49 sq. ins. or a net area of 2.19 sq. ins.

In a table on the properties of angles, we note that the distance from the back of the angle to the centre of gravity of the section is 1.01 ins. It is denoted by y in the figure. The eccentricity of the loading is the distance from the centre of the plate to the centre of gravity of the angle which is 1.01 + .1875 or 1.1975 ins. or almost 1.2 ins. Then the maximum tensile stress in the angle is given by the familiar formula:

Maximum unit stress = direct stress + secondary stress

$$= \frac{P}{A} + \frac{Pey}{I} \quad \cdots (29)$$

Where

P = load in lbs.
A = net area of section under stress.
e = eccentricity in ins.
y = distance in inches from back of angle to centre of gravity.
I = moment of inertia of the section.

The value of the secondary or flexure stress is obtained from the flexure formula $\frac{S}{y} = \frac{M}{I}$ or $S = \frac{My}{I}$ and $M = Pe$.

Introducing the arithmetical values into (29) we have:—

Maximum unit stress in lbs. per sq. in.

$$= \frac{20,000}{2.19} + \frac{20,000 \times 1.2 \times 1.01}{2.87}$$

$$= 9,132 + 8,446 = 17,578$$

The result shows the stress to be higher than that permitted by the specifications, therefore it will be necessary to choose a larger section. As a second trial, select a 4 × 4 × ⅜-inch angle. Obtaining, as before, the necessary values for substitution in (29) we have the maximum stress in lbs. per sq. in.

$$= \frac{20,000}{2.55} + \frac{20,000 \times 1.31 \times 1.14}{3.71}$$

$$= 15,893.$$

Apparently the section selected in the second trial will be satisfactory. The above analysis must surely show that eccentricity of loading cannot be ignored.

To determine the number of rivets to be used in the joint, it will be necessary to know the bearing and shearing value of a rivet for this case and use the smaller value. The single shearing value of a ¾-inch rivet is .4418 × 10,000 lbs. = 4,418 lbs., where .4418 is the area in sq. ins. of a ¾-inch rivet. The bearing value of a ¾-inch rivet against a ⅜-inch plate is 20,000 × ¾ × ⅜ or 5,625 lbs. The shearing value being less governs. The number of rivets required is $\frac{20,000}{4,418}$ or 5.

3. Eccentricity in a Beam Connection

In Fig. 19 is shown an ordinary beam connection. The load on the beam is such that "P" is the value of the end reaction, so that P is the load on the riveted joint. The line of action of P is located at the back of the connection angle as shown. Assume six rivets in the connection, distant d_1, d_2, d_3, etc. from the centre of gravity of the riveted connection. There are two forces acting on each rivet as follows:

(1) A direct shearing force due to the load and acting vertically through the rivet.

(2) An eccentric force P acting at a distance "a" from the centre of gravity of the riveted area. Its moment is Pa.

The direct force on any rivet is

$$\frac{P}{\text{No. of rivets}} = D_1 \text{ or } D_2 \text{ or } D_3, \text{ etc.}$$

The turning moment Pa is balanced by the resisting moments of the stresses in the rivets acting about the centre of gravity of the riveted area.

Let T be the turning force on a hypothetical rivet at unity distance from the centre of gravity. Then Td will be the turning force on a rivet at distance d from the centre of gravity, since the stress increases proportionally with the distance. The moment of this turning force Td about the centre of gravity is

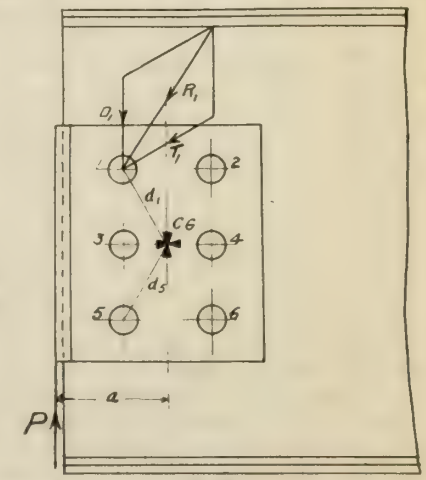

Fig 19

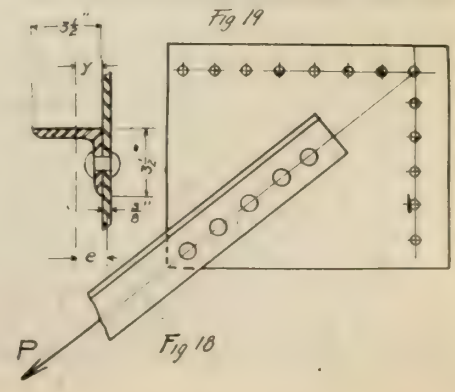

Fig 18

Td × d or Td^2. Then the resisting moment of all the rivets is the summation of all the Td^2 for all the rivets or Td^2, expressed mathematically, and this must equal Pa for equilibrium.

Therefore

$$Pa = \sum Td^2 = T\sum d^2$$

the T going through the summation sign since it is a constant.

Thus

$$T = \frac{Pa}{\sum d^2} \cdots (30)$$

Considering rivet No. 1, the direct shear is $\frac{P}{6}$ since there are six rivets and the turning force causing the secondary stress is Td_1, which is

$$\frac{Pa}{\sum d^2} \times d_1$$

The direction of the secondary stress is at right angles to the line joining the centre of rivet No. 1 to the centre of gravity of the joint. The combined stress is the vector sum of the two stresses and the graphical solution is indicated in Fig. 19. The solution by parallelogram of forces gives the vector sum and takes into account direction as well as magnitude. The resultant R_1 is the combined total stress in magnitude and direction as indicated.

(To be continued)

WELDING BROKEN ARMATURE SHAFTS

LARGE armature shafts occasionally break at the junction of the journal and the pulley end. While recognizing the adaptability of the Thermit welding process to the welding of all kinds of large steel shafts, operators sometimes in this case decide to scrap the old shaft, fearing that the heat of the steel produced by the Thermit reaction might injure the armature coils and produce short circuits. Where the armature coils, however, can be separated from the fracture by a few inches of molding sand (at least about 4 inches in the case of a 3 inch diameter shaft) a repair by this method is entirely feasible without injuring them, according to a statement by the Metal & Thermit Corporation, New York, if the following simple precautions are observed. There is no danger of damaging the armature windings through the effect of direct heat as the fracture is completely surrounded by molding sand and all preheating subsequent to heat from the Thermit steel is confined within this molding sand. The heat which is conducted along the shaft is readily taken care of either by directing an air blast on the shaft or, where necessary, by means of a specially constructed water cooler box with packing box on the shaft to prevent the possibility of any water whatsoever coming in contact with the windings. The windings themselves are further protected by being totally encased in an oil cloth and burlap bag.

In case the keyway of the pulley end of an armature shaft becomes badly worn, this worn end can be removed and a new oversize extension welded on and machined down. A large number of such extensions have been Thermit welded in the past.

Thermit, it may be explained is a mixture of finely divided aluminum and iron oxide. When this mixture is ignited a chemical reaction takes place with the result that the aluminum combines with the oxygen of the iron oxide to form aluminum oxide or slag in a highly superheated molten state while the iron is set free and is produced as liquid steel, also highly superheated (temperature approximately 5,000 degrees F.). The steel at this high temperature is poured around and between the sections to be welded which have been previously heated to a bright red heat. The sections at the fracture become dissolved and amalgamate with the Thermit steel so that finally the entire mass cools down to form a single homogeneous section.

VIGOROUS CAMPAIGN

The Canadian Pulp and Paper Association is conducting a vigorous campaign for the increase in exports of the Canadian product to the States. A recent statement has been prepared by the Association which explains the ability of the Canadian manufacturer to supply the requirements of the United States consumer. In the foreword of the statement the following appears, which would tend to do away with any uncertainty as to prices, etc. Production of paper increased from 150,000 tons in 1909 to over 850,000 in 1920. Today the Canadian newsprint mills are equipped to produce about 1,000,000 tons of paper a year. They are supported by what are admitted to be the greatest potential pulwpood reserves in the world.

"About 80 per cent. of the output of these mills is marketed in the United States. During the twelve months ended August 31st American newspaper publishers purchased and used no less than 637,266 tons of Canadian newsprint, exceeding the record of the preceding twelve months which included the period of the greatest demand for newsprint ever known.

"Contracts for next year's supplies of newsprint are now being negotiated. They show no diminution in the American demand for Canadian paper.

Iona, B. C.—The Iona Gypsum Co., who have been shipping a large amount of Gypsum to the U. S. market, principally Philadelphia and New York are about to reorganize. This will mean new management. It is stated by well informed persons that a large amount of money will be spent on improvements in order to make the plant a large producer on an efficient working basis. The product of the Iona gypsum mines is said to be equal to that of any gypsum deposits on the American continent. It is reported that a representative of Montreal capitalists is at present looking the plant over and the indications are that the coal interests will sell out. Should the proposed deal go through, there will be extensive alterations made to the plant and improved shipping facilities will be provided.

BUSINESS BETTER IN UNITED STATES

The First National Bank of Boston notes a distinctly better feeling toward business, not in the sense that business is free, active and profitable—for it is not—but because many, and the most difficult, steps in the business readjustment have already been taken, and persistently, if slowly, the products of the farm are being brought more nearly into balance with retail prices of goods. The downward trend of commodity prices for the moment has been checked, and in fact the average has risen slightly in recent weeks, lumber, copper, cotton, oil, wool, and some steel products contributing to the increase. While building construction awards are increasing and are now in normal proportions, the recovery in steel is being blocked by scant buying on the part of the railroads. The reason is obvious. The railroads' gross earnings for September were $120,000,000, or 20 per cent. less than in September, 1920. Only by cutting down expenses in every way, including paring down maintenance materials, was this enormous shrinkage offset. Heavy buying of steel by the roads under these conditions is out of the question. Transportation charges form so large a part of the final cost of goods that the demand for lower railroad rates, meaning further reduction in railroad wages, is growing more insistent and is being recognized as the barrier to a revival of business. The eleventh-hour rescinding of the railroad strike order was mainly in response to this public demand.

INCORPORATION

Samuel & Benjamin, Ltd., composed of S. Samuel, merchant, George T. Pepall, manager. C. Miller, H. M. Samuel and W. T. Louden all of Toronto and F. D. Benjamin of London, England. has been formed to purchase the business carried on in metals in Toronto under the firm name of M & L. Samuel Benjamin & Co. Capitalization of the new company is $2,000,000, head office in Toronto.

How to Make Use of Logarithm Tables

In This, the Second Article, the Method of Finding Logs and Anti-Logs Is Shown—Proportional Differences and the Treatment of Logs Having Negative Characteristics Are Also Taken Up

By F. H. FENNER

IN OUR last article we gave an illustration of the kind of problem that makes it absolutely necessary to use logarithms. We will not attempt at present to show the method of working that particular problem but will give some illustrations of applying logarithms to ordinary multiplication and division sums.

The cut herewith shows a partial table of logarithms, which are taken to six places of decimals. The column at the left marked N contains the number of which the logarithm is to be found. The next column contains the mantissa of the logarithm of that number, the characteristic being omitted. The reason that the characteristic is not put in is because, as explained in our last article, the characteristic depends on the number of integers, or whole numbers in the number. Thus, if the log. of 415 is sought, the characteristic would be 2. If the number is 41.5 then the characteristic would be 1, while if the number was 4.15 the characteristic would be 0. If the number was .415 the characteristic would be minus 1. .0415 would be minus .00415 would be minus 3 and so on. The mantissa in case would be .618048, as given in the first column of mantissa. The columns following the one containing the mantissa, and headed 0, are followed by columns headed 1, 2, 3, 4. 5, 6, 7, 8, 9, and a final column headed Diff. The way that these are read is as follows. If we want the logarithm of 4151 we first find the number 415 in the left hand column. The first two figures of the mantissa are 61. Looking under the column headed 1 we find four more figures 8153. The logarithm of 4151 is then 3.618153. The logarithm of 4152 would read by taking the first two figures from the column headed 0, and the next four from the column headed 2, and would be 3.618257, and so on, up to 4159.

Now if we have the logarithm and wish to find the anti logarithm or the number corresponding to the logarithm, we proceed in the opposite manner. If for instance we have the logarithm 2.-618571, we look up in the table till we find a logarithm beginning with 61 in the first column of mantissa. We then look along the other columns until we find the one containing the last four figures of the log. 8571. At the top of this column is the figure 5. The number is then 4155, and as the characteristic is 2 the number will be 415.5.

Now supposing instead of the logarithm or log. as it is usually abbreviated was 2.618469. There is no log exactly the same as this in the tables. The log. of 4154 is 618466, and the log. of 4155 is 618571. How are we to get the exact number? We must find the proportional difference. and to do so proceed as follows:

The nearest log. below the one we have is 618466, and the number corresponding to this is 4154. Now subtract the log. in the table from the log. whose number we wish to find. Thus 618469 less 618466 gives a difference of .3. Now multiply this difference by 100, which gives 30 and divide it by the number in the difference column, which is 105. This gives $\frac{30}{105}$ .1857 and this number must be added on the number already found which makes the

LOGARITHMS

COMMON LOGARITHMS OF NUMBERS (*continued*).

Partial Table of Logs.

number 41541857, and if the characteristic was 2 the number will be 415.41857. or 415.4186. The number thus lies between 415.4 and 415.5 and unless the calculation is to be very exact it is usually sufficient to take the nearest log. in the tables and neglect the proportional difference.

In case we wish to find the log. of a number that contains more figures than the tables give, for instance 41569. The characteristic will be 4 and the mantissa will be somewhere between 618676 and 618780. If we wish to get the exact log. we must find the proportional difference. To do this we multiply the figure or figures after the first four, in this case 9, by the number in the difference column. That is we multiply 9 by 105, and divide by 10. Add the quotient to the log. of the first four figures. Thus the log. of 41569 would be 4.618676+9x105945

As we have to divide by 10 this means that we place the 945 under the log. beginning at the second figure from the end thus

```
4.618676
      945
-----------
4.6187705
```

Thus the log. required is
4.6187705

Suppose we wanted the log. of 415698. The characteristic of the log. would be 5 and the mantissa would have to be found by proportional parts. If there is more than one figure over the number to be obtained directly, we must multiply the difference and divide by 100. This is most conveniently done as follows:

Find the log. of 4156 as before which is 618676 as before.

The figures remaining are 98. Then we have log. 415698

```
      =5.618676
9x105      945
8x105      840
-----------------
5.61877890
```

As already mentioned, it is but seldom that such a degree of accuracy is required but it shows how simply it can be attained if necessary.

Some Simple Examples

Having made clear just what logarithms are, we are now in a position to see the actual application in some of the simpler cases. We have stated that in order to perform multiplication of numbers we add their logarithms.

Multiply 4.5 x 4.
Log. 4.5 plus log. 4

```
.653213
.602060
-------
1.255273
```

Then the logarithm of the product is 1.255273. We must look up in the log. table for the anti-log. The small part of the logarithm table which we have been able to reproduce here does not contain this log. but it can be found readily by those possessing the full tables. Looking up this logarithm, we find that the anti logarithm is 1800, and as the characteristic is 1, our answer is 18.

Suppose now that we had wanted to divide 4.5 by 4, instead of multiplying we should have had to substract the log. of 4 from the log of 4.5 instead of adding. Thus

Log. 4.5 minus log. 4

```
.653213
.602060
-------
.051153
```

The anti logarithm of .051153 is 1125, and as the characteristic is nothing the answer is 1.125.

These are simple cases for illustration.

Now let us come to an important application of logarithms, and one where their usefulness will be apparent to all: We mean in the raising of numbers to powers or the extraction of the roots of numbers, in other words evolution and involution, or as many prefer square and cubes and their roots. Instead of the long and abstruse calculations with their immense possibility of error, the use of logarithms substitutes a simple subtraction or addition sum, or an even more simple multiplication or division sum. Let us take again the figures 45. We will say first of all that we want to square them, that is 45 x 45.

The log. of 45 is 1.653213, so that we must add the log of 45 to itself to get the log. of 452. This is exactly the same as multiplying the log. of 45 by 2, and as a matter of fact this is what is done. Thus to find the square of 45 we take the log. of 45 which is 1.653213 and multiply it by 2, which gives 3.306426 as the log. of the square of 45. Looking up the tables we find the number is 2025 and as the characteristic is 3.2025 is the square of 45.

Now if we wanted the square root of 45, instead of multiplying its log. by 2 we should divide its log. by 2 Thus the log. of the square root of 45 would

$$\text{be } \frac{\text{log. } 45}{2}$$

```
1.653213
---------
2
.826606
```

and the anti logarithm of .826606 is between 6708 and 6709. We can find this exactly by the method shown earlier. The next lowest log. to .826606 is .826593 and the difference is 13. The number in the difference column of the log. table is 65, so that we have 1300 divided by 65 which is 20 and the anti-log. of .826606 is 67082, and as the characteristic is 0 the square root log. 45 is 6.7082. It can be readily seen that if we had taken the number corresponding to the next lowest log. it would have made practically no difference in the result in this case.

From these two examples we get the rule. To raise a number to any power, multiply its logarithm by the index of the power. To extract any root of a number, divide its logarithm by the index of the power. To extract any root of a number, divide its logarithm by the index of the power. Here we have a very easily applied method of getting odd powers or roots or fractional powers or roots which it would be extremely difficult to get in any other way. This application of logarithms is worth the study if they are used for no other purpose. We now come to what may be called a special case, although they occur fairly often.

Suppose we have to raise a decimal quantity to a higher power or to find the root of a decimal quantity. Let us take first of all the raising to the 2nd power of a decimal quantity, or getting the square of a decimal quantity, say, .45. Now the log. of .45 is $\overline{1}.633213$ that is the characteristic is a minus quantity. Now how are we to multiply a log. containing a minus characteristic and a positive mantissa. There are several ways of doing this.

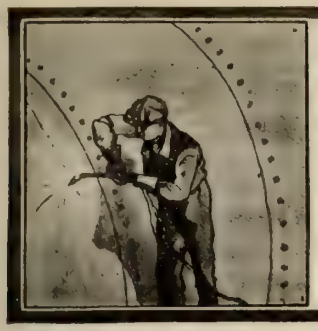
Let us take the easiest method first. which is to multiply the mantissa first, and then multiply the characteristic, and then add the two together. Thus we should have .653213 x 2=1.306426, and to this must be added the product of $\overline{1}$ x 2 which is of course $\overline{2}$.

Then we have

```
1.306426
  2.
-------
1.306426
```

The anti-log. of this is 2025 and as we have a minus characteristic the square of .45 will be .2025.

A second method is to add a positive number to the negative characteristic, and multiply in the ordinary way. After that is performed, the product of the added positive number and the multiplier is subtracted from the log. already found.



Using our same figures again for illustrative purposes, we have log. of .45 is $\overline{1}$ .653213. If we add 10 to the negative characteristic we shall have a positive characteristic 9. That is 10 plus $\overline{1}$ is 9. The log. would then be 9.653213 and this multiplied by 2 is 19.306426.

As we have added 10 we must now compensate for that by subtracting the product of $\overline{10}$ and 2 which is $\overline{20}$ and the log. will be

```
19.306426
20.0000000
----------
1.3064260
```

which is we see the same as before.

In our next article we shall give various examples of logs. applied to the working of actual formula.

WELDING AND CUTTING

Some of the Possibilities of Welding

How To Go After Business—Certain Points on Which the Success of Welding Hinges—Boiler Regulations—Usual Marine Repairs—Oxy-Acetylene Process

*By A. M. BARRY

ONE OF the most marked peculiarities of the business that comes to the door of the average welding shop is the tendency to suddenly vary in volume. One day the entire force will be on the jump from morning till evening, with part working overtime on the repair of an exceptionally heavy casting, which naturally calls for a prolonged and continuous performance of preheating and welding, and the very next day the boss finds himself puttering around the shop in search of jobs to keep the men busy. Quite naturally all repair work is wanted in a hurry, since a broken piece of machinery means a machine standing idle, so that there is a limit to the amount of work that can be carried over for the sake of having something for all the welders to do. Shall the welder sit down calmly when he has finished one repar and wait for something else to break? Not if he can help it. If it is a good sized shop there is probably a salesman out looking for machinery accident cases to hustle in for treatment, and if things refuse to break he investigates manufacturing processes to see if he can have parts of products sent to his shop to be assembled by welding. The names "Blank Welding and Mfg. Co.," and "Blank Welded Products Co." so frequently found over the doors of welding shops, indicate that production work is an important part of a thriving welding business.

A considerable volume of production welding for outside concerns has to be secured on each job in order to make the work profitable, because it requires practice to obtain sufficent speed on the work to justify making a price that will mean a saving to the manufacturer. Very often it is necessary to go to the trouble of making special jigs for holding the parts, or to the expense of having them made. Still the work is worth while if the price paid for it is enough to cover all the overhead with a slight margin of profit, for it can usually serve to keep the shop busy during the slack days.

When all other signs fail, that is when repair work inside and outside the shop falls off, and there is no demand for production work from other manufacturers, the welder still has a chance to keep busy by becoming a manufacturer himself. There is an almost unlimited number of metal specialties which can be turned out at small cost in a well equipped welding shop, and for which a local demand can be found.

The metal can be obtained in sheets, rods, tubes, plates, etc., and cut to any desired pattern with a cutting torch then welded together at odd moments, so that the cost of manufacturing is comparatively low. Some interesting work of this nature has been done, such as, auto axles, tanks, pans, screens, refrigeration equipment, house furnaces, depth bombs, aerial bombs, etc. The oxy-acetylene torch has scrapped many war vessels and guns. It saved the day on more than one occasion in quick repairs to the Allied Forces equipment both at sea and on land. Welding equipment is indispensible to every large industrial plant for repair work, so as to enable them to quickly repair small breakdowns. The larger repairs are usually handed out to an outside shop to handle because on large work special facilities, equipment, and organization is required to handle this work.

New uses and applications of these processes are being found every day. The field offered unlimited opportunities to the workman and expert to show his initiative and skill, but let me put before you that the success of welding depends on:

First—The proper preparation of the work.

Second—The proper selection of process.

Third—The use of reliable equipment and supplies.

Fourth—The skill of the workmen.

Fifth—The necessary equipment for preheating.

Sixth—The proper use of the preheating equipment before, during and after the welding.

Seventh—The necessary facilities to take care of the cooling of the casting after heating.

Eighth—The necessary and proper skilled supervision of the expert.

The following is descriptive of the industry:

Welder—The other day a big casting broke down in John Doe's Machine Works. Doe and the rest of his bunch all knew it was impossible to weld it.

Billy—Well, what became of it?

Welder—Why, they fooled me, I didn't know it was impossible to weld and they didn't tell me, so I went ahead and did the job O. K.

It is utterly impossible in this small space to go into detail or thoroughly cover the possibilities of welding. Every day new fields open up; jobs that were considered impossible a few years ago are today being welded as ordinary shop practice. Let me impress upon you that there is no guess work or chance in the welding field today, as it is accepted as standard practice in the railroad shops both here and on the American continent, and in Europe.

Shipyards throughout the world use all processes, and a great many large industrial plants have well organized welding departments to handle their repairs, where they save many thousands of dollars a year. In many countries there are large welding organizations manufacturing principally by the use of welding, —in some cases having on their staff as many as four hundred welders. In France during the war one shop alone employed twelve hundred women welders, working eight hours a day making bombs. Therefore you must realize it is impossible to do full justice to this field in so short a space. However, I will try to put before you what is being done, and some of its possibilities.

Failure and condemnation of welding is the direct result of welding equipment being placed in the hands of the unskilled and untrained workman, who with his unlimited nerve and irresponsibility undertakes, sometimes through force of circumstance, work utterly beyond the capacity of his equipment and skill. Result, a complete failure usually after considerable time and expense has been

*Presented before the Montreal Branch of Canadian Welding Society.

incurred taking out the broken part and replacing. This always creates a bad impression and unfortunately not the workman but the process is blamed. The Canadian Inter-Provincial Boiler Regulations in regard to welding are as follows:

Boiler Regulations

Autogenous Welding may be used in boilers in approved cases where the stress is carried by staying or other construction which conforms to the requirements of these regulations, and where the safety of the structure is not dependent upon the strength of the weld. Autogenous welding shall not be used in place of cauling or girth seams.

The efficiency of the longitudinal joint of a shell or drum when welded by the forging process shall be taken at not more than 50 per cent. of the solid plate for butt-welded joints, and 60 per cent. of the solid plate for lap-welded joints when calculating the maximum working pressure allowable by the formula in Section 193 of these Regulations.

Steel stays may be upset at ends but not welded in any way.

The ultimate strength of a joint which has been properly welded by the forging process may be taken at 50 per cent. of the tensile strength of the solid plate.

Cracks in shell plates or other parts of boilers subject to tensile stress shall not be welded.

Cracks not exceeding sixteen inches long in plain and corrugated cylindrical furnaces of internally fired boilers, and cracks not exceeding thirty inches long in stayed surfaces, such as fireboxes, back sheets and water legs of locomotive type boilers, boiler heads, tube sheets, combustion chambers, etc., may be welded, a hole being drilled at each end of the crack before welding to prevent the crack extending.

Cracks extending through the rivet holes in stayed plates only, may be welded, or if preferred the outer strip of plates extending from the rivet holes to the lap may be removed and the place where the strip of plate has been removed may be built up and reinforced by either of the above processes.

Cracks extending from the outer edge of rivet holes to the edge of lap in externally fired boilers may be welded, if not below the fire line of the boiler.

The beading on the ends of tubes may be welded to the tube sheet.

All caulking edges of plates of internally fired boilers may be reinforced by autogenous welding, but caulking edges of shell plates of externally fired boilers may be reinforced above the fire line only. When caulking edges of plates are thus reinforced the rivets must be cut out and redriven where considered necessary by the Inspector.

Shell plates of internally fired boilers only, and tube sheets in all boilers, which are reduced in thickness by corrosion, etc., may be reinforced, provided that the reduction in thickness does not exceed 25 per cent. of the original thickness of the plate and that such reinforcement does not exceed 200 square inches in area in any one plate.

Stayed surfaces such as wrapper sheets and legs of furnaces, etc., which are reduced in thickness by corrosion, etc., may be reinforced provided that the reduction in thickness does not exceed 40 per cent. of the original thickness of the plate ad that such reinforcement does not exceed 200 square inches in area in any one plate. If the reinforcing extends over braces or stays, the stays shall be removed and replaced so that the stays and braces shall come completely through the reinforcing. Where metal is deposited on stayed surfaces the operater shall hammer the deposited metal, when practicable, while in a glosing state.

When the corroded portion of a stayed surface exceeds 300 square inches in area the corroded part may be cut out and a new piece of plate welded in, the welding edge being V'd or bevelled along the joint, prior to welding. The size of the piece of plate welded in should not exceed 24 inches square or if other shape than square it should not be longer than 30 inches in any one direction. Stays, braces or rivets must be replaced so as to pass through the new plate as before.

Cracks in wrought iron or wrought steel headers of water tube boilers and cracks and sandholes in cast steel or cast iron headers, manifolds, crosses, tees and elis, may be repaired by welding cracks or flowing metal into sandholes but may not be reinforced by building up. After repairing they shall be subjected to a hydrostatic test pressure of three and a half times the working pressure before being used.

Thermit, electric and oxy-acetylene welding are all known as the autogeuous welding processes, the proper selection of which for the individual job usually calls for the highest skill on the part of the expert, although he has certain definite rules to go by. For instance, the heavy welds in steel or cast iron are at once, to my mind, thermit welding jobs. The prncipal reason is its speed therefore low cost, its automatic action, and that the heavy work is done by the air compressor. Its competitor, in my opinion, is the oxy-acetylene process, which is slow in comparison, altogether dependent on the skill, mood, humor, and endurance of the operators, who would make the weld drop by drop, who would have to contend with heat, smoke sweat, cramped positions for hours at a time. This usually results in failures. Not because the process is at fault, but because of the physical difficulties to be overcome.

The oxy-acetylene process is selected for bench work or the smaller castings in steel and cast iron and always for the other metals such as, malleable iron, aluminum, brass, copper, platinum, tin, zinc, bronze, or bell metal, silver or gold. The oxy-acetylene and electric salesmen of apparatus are constantly at war with each other on the merits of their respective apparatus', both claiming that they can do the job by their process cheaper and better than the other fellow. Experience goes to show that electric welding is selected for steel welding, principally on boiler repairs and steel tank manufacturing. In boiler repairs not because this weld is a better weld, (in fact according to my observation, it is not as perfect a weld as the oxy-acetylene), but because the heat is more concentrated. While making repairs to boilers, which usually consist of building up of corroded or wasted places, building up leaky caulking edges, welding up of cracks and fire cracks; further trouble is not started by the loosening of rivets from the heat of welding which would be the case should oxy-acetylene be selected on account of the great radiation of heat during the progress of the job. By the electric welding process the heat is much more concentrated, therefore the work is nearly cold, while with oxy-acetylene process we have large sections white hot, with more metal red hot. If rivets or staybolts are in these sections we have rivets that are loose in the hole, the same arguments applying to staybolts.

We will discuss briefly the class of work that thermit welding is used on.

Principally in weldng heavy sections, when broken, such as locomotive frames, steam-shovel parts, heavy frames, rolls, stone crusher parts, contractors' equipment, heavy crank shafts, shears, either in cast iron or steel. Results in steel are to my mind always perfect. In cast iron a small percentage of failures and hard welds. The marine repairs by the Thermit processes usually consist of repairs to shafts, connecting rods, stern frames, rudder shoes, stem posts, rudder frames, anchors, and heavy davits. The Thermit process is also used in pipe and track welding to elimiñate joints. Electric welding consists of two processes, A.C. and D.C. with both processes, using two systems, metal electrode and carbon.

The carbon is used principally in cutting steel, in welding, in building up metal where required, such as in defective steel castings. The metal electrode is also used in building up of corroded or wasted parts, welding up of cracks and fractures in boilers, tanks, and of course in the manufacturing of steel tanks, smokestacks, acid-stills, pressure vessels, vacuum tanks and equipment, also making good, worn parts in machinery, such as building up of shafting after wear to oversize, ready to be machined to full size. Electric welding of cast iron is usually done by first opening the fracture by chiselling a "V" then drilling and tapping in steel studs into the V leaving them about 1-8 in. high, then using a good Swedish iron electro. This electrode is usually 5-32 in diameter filling up the "V" and heavily reinforcing when possible.

Usual Marine Repairs by Electro Welding

The usual marine repairs are filling up corroded parts and making good wastage by building up. Welding up of cracks, and in some cases building up heads of staybolts when the threads are stripped.

In marine construction electric welding is used for the manufacture of steel bulls instead of rivets; fastening on of brackets to houses of ships, fastening of railings, manufacturing of covers, holds, smoke boxes, stacks, steel masts, oil tanks, tank wagons, oil drums, transformers, air receivers, brine tanks, double jacketed tanks, etc. Sometimes a combination of welding and riveting is used, as example, riveting seams of the ordinary tanks, and welding on the heads thus saving the labor of flanging, punching, rivets, and material.

The Oxy Acetylene Process

The oxy-acetylene process, to my mind at least, is the only process by which all metals can be welded or any combination of metals. By its use it is possible to weld any broken part that is made of metal. Its usual application in a welding shop is to repair automobile parts, cylinders, frames, brackets, gears, shafting, (boiler tubes) crank cases, pipe and pipe fittings, intricate machinery parts (anything from artificial legs to marine boilers, from piping 40 ft. under ground to bells in church towers.)

Oxy-welding is not a cheap repair process when working on small castings on account of the high cost of labor, gases, material, maintenance of equipment and unseen losses such as ends of rods, gas not accounted for, occasional idleness, defective work and the high overhead necessary. In manufacturing by oxyacetylene the field is the same as above in Electric process, with what I consider the additional advantage of the cutting of steel, which can be done by hand or machine. In flat surfaces, and heavy cuts, such as Armord plates and ship plates, the Oxy-graph is used, giving cuts that are smooth and accurate. By hand, ordinary cutting of plates, using a roller attachment gives good results up to 1 in. thickness. Heavier cuts requiring accuracy should be made by these of the machines already mentioned. By hand we cut up cast iron, scrap steel, castings, old boilers, remove rivets, wreck bridges, steel cars, ships, fortifications, guns, etc. It is possible to use the cutting torch under water in depths possible for divers. Some remarkable underwater cutting has already been accomplished such as cutting to the bullion rooms and mail rooms in the Empress of Ireland. The girders and steel work of the Quebec Bridge that were under water were cut by divers using oxy-cutting equipment. These examples are local ones, but during the recent Great War the British Admiralty used the torch under water very extensively. I understand that the Germans removed the blockade ships that were sunk in the channel at Zeebrugge by the use of the cutting torch. Therefore, you must realize that the oxy-cutting torch and its twin, the oxy-welding torch are two very important tools, that are comparatively new instruments placed in the hands of the Engineering Profession.

The Demand for Canadian Mica

Recently, several Canadian firms have been requesting information regarding the possibilities of marketing mica in the United Kingdom. This has led to a thorough investigation, the result of which, according to trade commissioner Harrison Watson of London, England, is as follows:

Although the mica trade, in common with other branches of business, is quiet, the situation is less bad than in most other commodities, and the chaotic condition which prevailed some years ago has to a great extent passed off. Unfortunately, however, the discovery and development of important new sources of supply of amber mica have radically impaired the demand for Canadian mica.

The consumption of mica in the United Kingdom, although temporarily interrupted by the war, has steadily increased, and whereas total importations in 1910 amounted to 28,113 cwt., these reached 72,383 cwt. in 1918 (the top year) and amounted to 65,866 cwt. in 1919, and 71,500 cwt. in 1920. For many years British India, partly owing to the perfected organization of the industry and trade, has been the chief source of supply, while Canada's contribution has been comparatively small; her share, which in 1910 amounted to 1,366 cwt., had fallen in 1918 to 480 cwt., and in 1919 was 780 cwt. The figures for 1920 have not yet been issued.

Even if these quantities do not really represent all the Canadian mica which has come to this country, because it is certain that owing to American control of the business, a considerable proportion of Canadian mica has reached this market through the United States, and been attributed not only by the Customs but by the trade here to that country instead of to Canada, the amount has been insignificant in comparison with Indian supplies.

It is to be regretted that, owing to carelessness shown by certain shippers as regards preparation and grading, the reputation of Canadian mica in this market has never attained the position to which its quality entitles it, and the bulk of the trade has been conducted by one firm which has throughout championed its merits. Indeed, one of the leading London mica firms interviewed, states that not only is there no established market in London for Canadian mica, but as far as their knowledge goes none has been directly offered in London for many years past.

The firm in the north of England which has practically had a monopoly of such Canadian amber mica as has reached this country, now reports that the demand for Canadian mica has completely fallen away, and it is not the everstocked condition of the market and dullness of trade which is responsible for this, but the discovery in recent years of excellent amber mica in Madagascar, where such quantities exist, and have been mined and finished, that supplies at the moment exceed the world's present demand, and large quantities are awaiting shipment with no buyers.

This mica runs to a much larger grade than the Canadian (over 50 per cent. of the production being equal in size to 2 by 4 to 3 by 5 Canadian grade). It has a high dielectric strength, and it is stated that it is "free from the cracks and waves and internal faults so common in Canadian amber." It is sickle trimmed, sent out with all the waste cut off, and is 33-1/3 per cent. below the present Canadian amber mica prices. The very cheap labor obtainable in Madagascar and the present rate of exchange (the currency being French francs), while Canadian funds are at a premium, absolutely prohibit business from Canada. While this latter feature is of course temporary, there can be no doubt that the quality of the Madagascar mica and the favorable conditions under which it is mined and finished, will render it extremely difficult for Canadian producers to compete in this country upon a profitable basis in the future unless they can substantially reduce their prices.

It is advantageous to take this opportunity to point out to Canadian correspondents who apply for information as to prices which they can anticipate being able to obtain for their mica in this market, that the value of the article depends entirely upon the quality, size, color, grading, and similar attributes of the particular consignment, and that importers repeat their inability to express even the vaguest opinion as to values until they can personally examine the mica offering. Consequently, the only method of testing prospects is for the Canadian shipper to submit a small trial lot, say one case of each variety, to a responsible firm, and ask for their report.

VERTICAL HOLLOW CHISEL

An electric driven vertical hollow chisel mortiser has been recently placed on the market by the Oliver Machinery Co., Grand Rapids, Mich. The driving motor is built into the mortising head or ram. This motor operates on either two or three phase 60-cycle current, at a speed of 3,600 r. p. m. The housing for the motor and head is in one piece and the rotor of the motor is mounted directly on the machine spindle, which runs in ball bearings. The motor is connected by means of a flexible Greenfield conduit to a safety enclosed starting switch with fuses. This construction does away with a countershaft pulley and belts. The machine is equipped with a compound table having a handwheel, rack-and-pinion-feed and a clamp for the work. It is provided with the usual bushings and wrenches.

WHAT OUR READERS THINK AND DO

COMPOUND COLD TRIMMING DIE

By A. J. Q.

The sketch at Fig.1 shows a forged steel barrel spud in its finished condition, that is after it had been cold trimmed, this process removing the excess metal from both the outside and inside diameters The usual method of accomplishing this is to make two dies, one for the inside and one for the outside. Of course this means two operators and two handlings.

The punch and die shown at Fig. 2 was designed to accomplish the work in one operation. The construction is quite clear, and the die on the top side is fitted with a mechanical knockout. The action is as follows: On the up stroke of press the knockout plate hits the knockout bar, and three pins eject the trimmed piece out of the die.

The punch on the bottom is cupped out to fit the forging, and is provided with a spring stripper which strips the outside fin. The fin or slug from the center hole drops through the die to the floor. The die was built correctly, yet was not a success for the following reasons:

A large number of forgings were made before any trimming was attempted and it was found that the forgings were not concentric as to their outside and inside diameters. Therefore when placed on the trimming die, (which of course has two concentric cutting edges) the outside trimming die instead of simply cutting away the flash, also took a shave from the forging itself. In addition to disfiguring the work, this caused a very heavy strain on the die itself and on the punch press in which it worked. For this reason it was necessary to revert to the old method of trimming the outside and inside in two separate operations. The eccentric forgings were caused by the forging dies "shifting" thereby changing from the correct alignment of the top and bottom impressions.

THE WINNING NEWS ITEM

Firstbrook's box factory at Thessalon, Ont., which has been closed for the past two months, has re-opened under new management, and have taken on all their old employees. Submitted by John McCampbell, Thessalon, Ont.

Editor's Note:—Have you an item that will secure a prize. If so—send it in NOW.

CONTEST WINNERS

We now clean up the results of all answers in the recent contest regarding references to advertisements appearing on various pages of Canadian Machinery. First we will consider the November 17th contest. No reader submitted a correct list to this issue, while in the Nov. 24th contest, several contestants were correct, but L. T. Churchill, 912 First Ave., Calgary, Alta., was the lucky reader to have his list picked up.

A. H. Scollide, London, Ont., was the fortunate winner in the Dec. 1st. contest, and in this case four readers submitted correct lists. Lack of space prevents publishing these names in detail. Scales are being forwarded the winners. Have you tried our new contest yet?

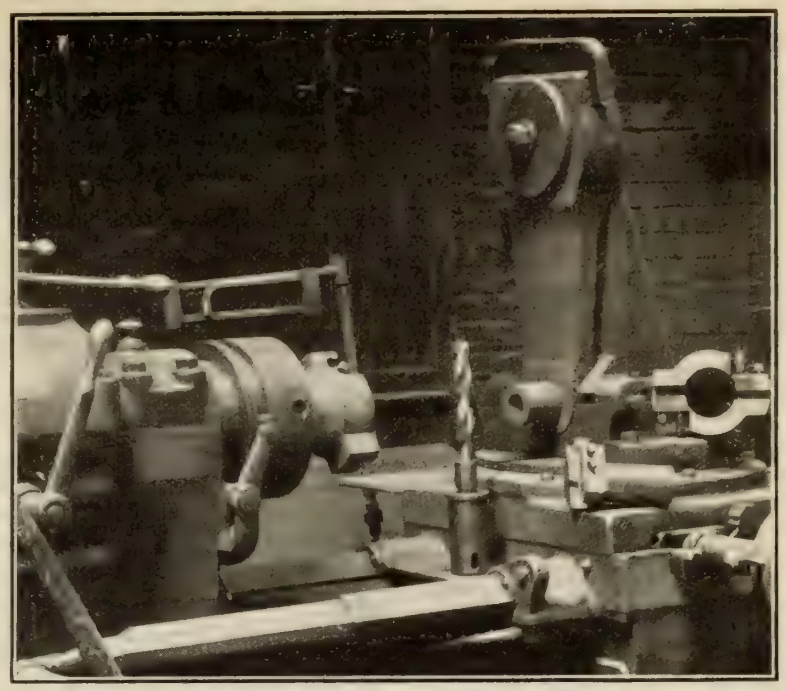
PAPER MACHINES

In the Sept. 22nd. issue of Canadian Machinery, also in the Oct. 20th Power House, we published a news item regarding Canadian built paper machines. An error was made in this item, a portion of the same reading as follows: "While these machines were being built, the makers rebuilt parts of these other machines." The word these, should have read **three.**

As first published, the item might create the impression that the Dominion Engineering Works, Montreal, the firm

making these machines, had to re-build parts of the machines they were building. The intention of course was to point out that they not only built the two 166 in. machines, but at the same time built a 90 in. and a 148 in. machine, and rebuilt three machines for other mills.

The item also mentioned a 1418 in. machine. Naturally readers will readily understand that 148 in. was intended and that the linotype operator merely got very generous with his figures.



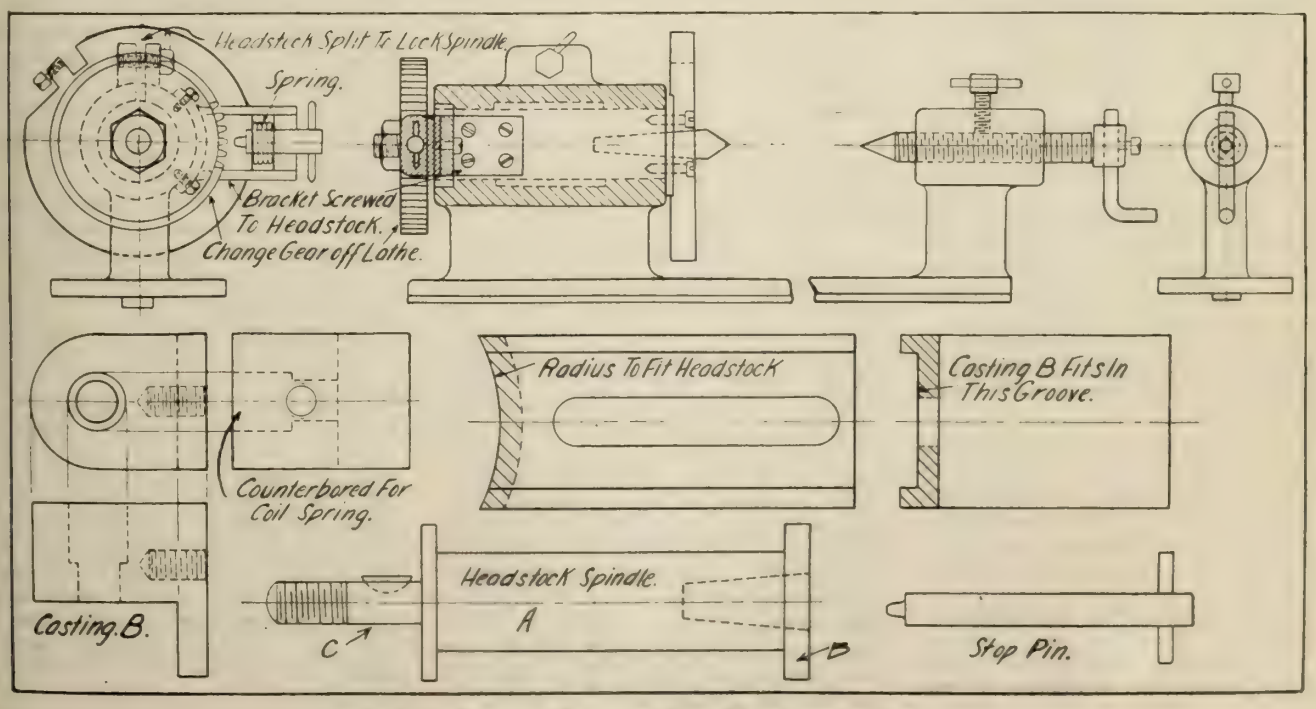
GEAR CUTTING FIXTURE

By W. H. Williams

Having a large amount of small gears to cut, and not being blessed with a dividing head in the shop, which was a small one, we made a fixture as shown in the accompanying illustration. It might be well to mention that the gears to be cut were of two sizes, 60 and 80 teeth; 20 diametral pitch, 1-8 in. face, with a 3-8 in. bore. The gear blanks were punched out on the press, and 12 blanks were placed on a suitable arbor, after the center hole had been drilled. Of course sufficient material was left on the outside to allow a light cut being taken to ensure concentricity.

It will be noted that the head and tailstock of the fixture is one solid casting this being bored at one setting to ensure alignment. The tailstock is tapped 7-8 in. as shown, and a screw inserted. The spindle A, fits into the headstock, and a driving plate was bolted to flange B. A change gear from a lathe was used as an index plate, this fitting on spindle at C.

The indexing device consists of two castings, one bolted to the side of headstock, the other sliding in a groove cut in the first, and held by screw through slot. This slot gives adjustment for different sized gears, and the stop pin is shaped at the end to fit between the teeth, being held in place by a coiled spring. The headstock is of course split to clamp the spindle while cutting.



Showing how the Turret Lathe was used to turn, drill and face.

TURRET LATHE IN NEW ROLE

By J. H. Rodgers

An interesting machining operation is shown in the accompanying illustration. The operation consists of turning, drilling and facing the trunnion of eccentric crank for Baker or Walschaert valve gear. A special fixture for holding the work is bolted to the revolving base of the machine turret, which is rigidly secured in a fixed position for this particular job. Vertical alignment is obtained by means of the jig face, and slight adjustment only is required to bring the rough trunnion central with machine spindle.

Four changes of tools are used in performing the complete operation. These are held alternately in the collet chuck, insertion and removal being carried out without stopping the machine. Double cutter box tools are used for roughing and finishing the outer diameter and facing back shoulder; bolt hole is drilled and end machined to proper length by special facing cutter. The complete operation is accomplished in 28 minutes, a great saving over the former method.

Detailed sketch showing the various parts for the gear-cuting fixture.

The Important Question Of Responsibility

Not One Individual But Every Department Is Needed to Keep Plants Operating—Responsibility Depends Upon Duties—Comprehension Is a Quality Vital to Every Business

*By W. J. HISCOX

IT IS not the concern of but one individual, or of even one department, to "keep the shops going." It is the concern of every department, to a greater or a lesser degree, and the sooner this is understood the better it will be for all concerned. There are, of course, departments or individuals primarily responsible, but these do not by any means exhaust the list, and there are many instances to prove that, even though these are doing their part, their efforts are not always attended with success, the reason being that some of the more remotely connected departments have failed to discharge their obligations, and the effect is felt.

Sometimes it is actually the fault of the shops, and by the term "shops" is meant the manufacturing departments. It is obvious that in order to ensure the prosperity of the factory the manufacturing departments must be fully employed, or, in other words, there must be no "waiting time." The shop foremen fully appreciate this, and yet there are times when they themselves are responsible. They will not admit this, of course, and are quite prepared to prove that someone else is at fault.

It is not good business on the part of anyone to endeavour to blame another, or even to rely upon excuse. Many troubles, ostensibly traceable to one individual, could be obviated if another would extend himself. It is so easy to wait until the thing comes along, and if it does not come to disclaim all responsibility. Technically one is right, but in practice wrong; and after all, it is the practical things which count. "I relied upon So-and-so, and he failed me," is not the excuse of the business man, and yet it is heard in most factories. "You are responsible—not I." How paltry it sounds—and is! One foreman blamed the progressman because he did not complete a job to time, on the score that the material was late. "But what effort did you make?" asked the manager, and the foreman could make no reply. "Then I hold you responsible in the highest degree," went on the manager, "for the progressman made an attempt, and you did not."

It is not only indirectly that the foreman is culpable. Often he is the direct cause of the delay. In one factory he had had advance information of work required, this being given to enable him to ascertain that all tools and jigs were available and in good order, and also to enable him to place his requisition for material with the store early enough. But he failed upon both counts. In the first place he sent his requisition for material to the store just at the time that the work should be put in hand, and then blamed the store for the waiting time that had to be given.

He did not appreciate that the storeman required time to execute the order, and that requisitions of other foremen had to be dealt with first. This type of man only thinks of himself and his own requirements, and he gives no thought to the fact that his order is but one of many. He may say with perfect truth that his order could be handled by the store in ten minutes, but the storeman is not waiting for a job, and it may be that an hour must elapse before that specific requisition comes up for treatment.

The Foreman

As far as the tools were concerned he was equally at fault, for he did not trouble to apply for these until they were actually wanted. Then he discovered that they were under repair in the toolroom, or, upon taking them from the tool store, that they needed adjustment. He may advance a number of excuses which in his eyes are quite legitimate. If they were in the toolroom the order was given in plenty of time and if they needed adjustment then they should not have been in the tool store.

All this is very well, and no doubt someone blundered. But because that has happened, it does not free the foreman from responsibility. Had he done his duty, the effect of the blunder would have been obviated, or at least minimised, and his excuse is not valid He should have known before the tools were actually required that they were not available, or that they needed adjustment, and then he could have put in hand another job, and so obviated waiting time. Then he could have lodged his complaint, and the blunderer would have received his just deserts.
